$k_{OH}(\text{aq.}) = 6.4 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from $t_{1/2} \sim 4-11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1-10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (0.36 - 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5-40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 160 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 177 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4-11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1-10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991)

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 160 \text{ d}$ for high-dose treatment, $t_{1/2} = 177 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.49 2,2',4,5'-Tetrachlorobiphenyl (PCB-49)

Common Name: 2,2',4,5'-Tetrachlorobiphenyl

Synonym: PCB-49, 2,2',4',5-tetrachlorobiphenyl, 2,2',4,5'-tetrachloro-1,1'-biphenyl

Chemical Name: 2,2',4,5'-tetrachlorobiphenyl

CAS Registry No: 41464-40-8

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

66.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

211.6 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

23.4 (differential scanning calorimetry, Miller et al. 1984; Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

69.04 (Miller et al. 1984)

69.01, 64.3 (exptl., calculated, Chickos et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.392 (mp at $66.5^{\circ}C$)

0.411 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.0164 (generator column-GC/ECD, Miller et al. 1984,1985)

0.0202, 0.0193, 0.0232, 0.0266 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.00708 (GC-RI correlation, Burkhard et al. 1985a)

0.0170 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.0167, 0.0162 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.00742 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

$\log(P/mmHg) = 10.60 - 4440/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.0123, 0.0182 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4229/(T/K) + 12.41$ (supercooled liquid P_L GC-RT correlation, Falconer & Bidleman 1994)

0.00955 ($20^{\circ}C$, supercooled liquid P_L , from Falconer & Bidleman 1994, Harner & Bidleman 1996)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ as indicated):

20.27 (calculated, Murphy et al. 1983)

47.72 (calculated-P/C, Burkhard et al. 1985b)

27.96 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

37.90 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

21.28 (wetted-wall column-GC/ECD, Brunner et al. 1990)

35.79 (calculated-QSPR, Dunnivant et al. 1992)

22.8 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

39.9 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 25 \pm 2$ kJ/mol, $\Delta S_H = 0.05 \pm 0.01$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, log K_{OW} :

- 6.23 (calculated- π constant, Bruggeman et al. 1982)
- 5.73 (generator column-GC/ECD, Miller et al. 1984, 1985)
- 6.22 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)
- 5.86, 5.98, 5.77, 5.86 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 6.361 ± 0.046 ; 6.23 (slow stirring-GC, calculated- π const., De Bruijn et al. 1989; De Bruijn & Hermens 1990)
- 5.87 (recommended, Sangster 1993)
- 6.38 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C or as indicated and reported temperature dependence equations.

- 8.57 (20°C, generator column-GC, measured range -10 to 20°C, Harner & Bidleman 1996)
- 9.64, 9.08, 8.57, 8.21 (-10, 0, 10, 20, 30°C, generator column-GC, Harner & Bidleman 1996)
- $\log K_{OA} = -4.96 + 3981/(T/K)$; temp range -10 to + 20°C (generator column-GC, Harner & Bidleman 1996)
- 9.08 (10°C, estimated, Thomas et al. 1998)
- 9.50, 8.63; 8.48 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
- 8.34 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF:

- 4.84; 6.37 (zebrafish: log BCF_w wet wt basis; log BCF_L lipid wt basis, Fox et al. 1994)
- 4.84, 6.38 (zebrafish, kinetic approach: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, log K_{OC} :

- 5.71 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
- 5.90 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 5.50 (soil, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25-60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 6.2 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from $t_{1/2} \sim 4-11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1-10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (0.36 - 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5-40 \text{ d}$ at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 3200 \text{ d}^{-1}$; $k_2 = 0.0458 \text{ d}^{-1}$ (zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 158 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 196 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25-60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);
tropospheric lifetime of 8.5-40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11$ d in freshwater systems, $t_{1/2} = 0.1\text{--}10$ d in cloud water, $t_{1/2} > 1000$ d in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991)

Groundwater:

Sediment:

Soil: Sorption-Desorption Rate Constants: release rate constants k_d for labile PCBs sorbed to utility substation soils are: $k = 0.25\text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.99\text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 1.31\text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.39\text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from first day gas-purge experiments; release rate constants k_d for nonlabile PCBs sorbed to utility substation soils are: $k = 0.00094\text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.00243\text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 0.00168\text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.00147\text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from 120–195 d experiments (Girvin et al. 1997).

Biota: depuration $t_{1/2} = 158$ d for high-dose treatment, $t_{1/2} = 196$ d for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.50 2,2',4,6-Tetrachlorobiphenyl (PCB-50)

Common Name: 2,2',4,6-Tetrachlorobiphenyl

Synonym: PCB-50, 2,2',4,6-tetrachloro-1,1'-biphenyl

Chemical Name: 2,2',4,6-tetrachlorobiphenyl

CAS Registry No: 62796-65-8

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

45.0 (calculated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

87–89 (Webb & McCall 1972; Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.2024

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point,)

211.6 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

46.02 (Hinckley et al. 1990)

46.1 (Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F:

0.243 (calculated, assuming $\Delta S_{fus} = 56$ J/mol K, Mackay et al. 1980)

0.316 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.046 (shake flask-GC/ECD, Wallnöfer et al. 1973; Hutzinger et al. 1974)

0.0265 (shake flask-GC/ECD, Haque & Schmedding 1975)

0.016 (shake flask-LSC, Metcalf et al. 1975)

0.0060 ($16.5^{\circ}C$, shake flask-GC/ECD, Wiese & Griffin 1978)

0.0223 (shake flask-GC/ECD from Aroclor 1242 mixture, Lee et al. 1979)

0.055 (generator column-GC/ECD, Bruggeman et al. 1981)

0.0365 (generator column-HPLC/UV, Huang 1983)

0.027 (generator column-GC/ECD, Miller et al. 1984; 1985)

0.0237, 0.0279, 0.0335, 0.0335 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.170 (generator column-HPLC/UV, Billington et al. 1988)

0.110; 0.461 (generator column-GC; supercooled liquid S_L , calculated-mp, Dunnivant & Elzerman 1988)

0.0153 ($22^{\circ}C$, generator column-GC/ECD, Opperhuizen et al. 1988)

0.0161 (shake flask-LSC, Eadie et al. 1990)

$\log (S_L/(mol/L)) = -0.790 - 3352/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

0.0923 (calculated-mp and K_{ow} , Ran et al. 2002)

0.199, 0.140 (supercooled liquid: derivation of literature-derived value, final-adjusted value, Li et al. 2003)

$\log S_L/(mol\ m^{-3}) = -1103/(T/K) + 0.37$ (supercooled liquid, FAV final adjusted eq., Li et al. 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.00733 (solid P_s from GC-RT correlation, Westcott & Bidleman 1981)

0.00253, 0.0048 (solid P_s , 25, $30^{\circ}C$, gas saturation-GC/ECD, Westcott et al. 1981)

$\log (P_s/mmHg) = 11.8 - 4920/(T/K)$, temp range 30 – $40^{\circ}C$ (gas saturation-GC, Westcott et al. 1981)

0.104; 0.428 (solid P_s ; supercooled liq. P_L calculated from P_s using fugacity ratio F, Neely 1981)

0.0188, 0.0165 (P_{GC} by GC-RT correlation, different GC stationary phases, Bidleman 1984)

- 0.0104 (supercooled liquid P_L , converted from literature P_S with ΔS_{fus} Bidleman 1984)
 0.0159, 0.0229 (supercooled liquid P_L calculated from P_{GC} , GC-RT correlation, different stationary phases, Bidleman 1984)
 0.00492 (GC-RI correlation, Burkhard et al. 1985a)
 0.00497; 0.0193 (selected exptl. P_S ; supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985)
 0.0184, 0.0173 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)
 0.0049; 0.0020 (selected solid P_S ; supercooled liquid P_L , Shiu & Mackay 1986)
 0.00904 (20°C, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)
 0.0127; 0.0546 (calculated-S \times HLC; solid P_S ; supercooled liquid P_L , Dunnivant & Elzerman 1988)
 $\log (P/\text{mmHg}) = 10.60 - 4430/(T/K)$ (GC-RT correlation, supercooled liquid, Tateya et al. 1988)
 0.0104, 0.008 (supercooled P_L , converted from literature P_S with different ΔS_{fus} values, Hinckley et al. 1990)
 0.0188, 0.012 (P_{GC} by GC-RT correlation with different reference standards, Hinckley et al. 1990)
 $\log (P_L/Pa) = 11.74 - 4127/(T/K)$ (GC-RT correlation, Hinckley et al. 1990)
 0.0132, 0.020 (supercooled liquid P_L ; GC-RI correlation, different stationary phases, Fischer et al. 1992)
 $\log (P_L/Pa) = -4220/(T/K) + 12.36$ (supercooled liq. P_L , GC-RT correlation, Falconer & Bidleman 1994)
 0.00690; 0.00218 (solid P_S ; supercooled liq. P_L , Passivirta et al. 1999)
 $\log (P_S/Pa) = 14.77 - 5087/(T/K)$ (solid, Passivirta et al. 1999)
 $\log (P_L/Pa) = 12.36 - 4220/(T/K)$ (liquid, Passivirta et al. 1999)
 0.0033–0.013; 0.00901–0.0512 (literature P_S range; literature P_L range, Delle Site 1997)
 0.00904 (supercooled liquid P_L , calculated-MCI $^3\chi$ and Characteristic Root Index CRI, Saçan & Balcioglu 1998)
 0.0107, 0.0120 (supercooled liquid P_L ; LDV literature derived value, FAV final adjusted value, Li et al. 2003)
 $\log (P_L/Pa) = -4190/(T/K) + 12.08$ (supercooled liquid, linear regression of literature data, Li et al. 2003)
 $\log (P_L/Pa) = -4059/(T/K) + 11.69$ (supercooled liquid, FAV final adjusted eq., Li et al. 2003)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 31.41–53.7 (calculated-P/C, Westcott et al. 1981)
 14.1–53.7 (calculated-P/C, Westcott & Bidleman 1981)
 94.15 (gas stripping-GC/ECD, Atlas et al. 1982)
 22.29 (calculated-P/C, Murphy et al. 1983)
 26.34 (calculated-P/C, Murphy 1984)
 31.41–53.70 (calculated-P/C, Bidleman 1984)
 53.20 (calculated-P/C, Burkhard et al. 1985b)
 2.53 (batch stripping-GC, Hassett & Milicic 1985)
 12.16 (20°C, gas stripping-GC, Oliver 1985)
 47.59 (calculated-P/C, Shiu & Mackay 1986)
 24.11 (20°C, calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)
 34.65 (gas stripping-GC/ECD, Dunnivant & Elzerman 1988)
 44.04 (calculated-molecular connectivity indices, Sabljic & Güsten 1989)
 20.27 (wetted-wall column-GC/ECD, Brunner et al. 1990)
 32.34 (calculated-QSPR, Dunnivant et al. 1992)
 16.4* (20°C, gas stripping-HPLC/fluorescence, measured range 10–48°C, ten Hulscher et al. 1992)
 17.0 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996)
 28.78 \pm 3.4 (gas stripping-GC/ECD, Girvin et al. 1997)
 $\log [H/(Pa \text{ m}^3/\text{mol})] = 13.15 - 3552/(T/K)$ (Passivirta et al. 1999)
 31.07* \pm 0.42 (gas stripping-GC, measured range 4–31°C, Bamford et al. 2000)
 $K_{AW} = \exp[-(30.5/\text{kJ}\cdot\text{mol}^{-1})/RT] + (0.066/\text{kJ}\cdot\text{mol}^{-1}\cdot\text{K}^{-1})/R$; where $R = 8.314 \text{ J}\cdot\text{K}^{-1}\cdot\text{mol}^{-1}$ and temp range: 4–31°C
 (gas stripping-GC, Bamford et al. 2000)
 28.27 (20°C, selected from reported experimentally measured values, Staudinger & Roberts 2001)
 $\log K_{AW} = 6.427 - 2530/(T/K)$ (van't Hoff eq. derived from lit. data, Staudinger & Roberts 2001)
 31.3 (exptl. data, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 31 \pm 3 \text{ kJ/mol}$, $\Delta S_H = 0.07 \pm 0.01 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004
 28.18, 25.12 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

$\log [H/(\text{Pa m}^3/\text{mol})] = -2189/(T/K) + 8.79$ (LDV linear regression of literature data, Li et al. 2003)

$\log [H/(\text{Pa m}^3/\text{mol})] = -2956/(T/K) + 11.32$ (FAV final adjusted eq., Li et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 3.91 (shake flask-radiolabeled- ^{14}C -LSC, Metcalf et al. 1975)
- 5.81 (Hansch & Leo 1979)
- 6.26 (RP-TLC- k' correlation, Bruggeman et al. 1982)
- 6.09 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)
- 5.81, 5.87, 5.43, 5.80 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 6.02 (calculated-UNIFAC activity coeff., Banerjee & Howard 1988)
- 5.81 (generator column-GC, Larsen et al. 1992)
- 6.00 (HPLC- k' correlation, Noegrohati & Hammers 1992)
- 5.79 (recommended, Sangster 1993)
- 6.09 (recommended, Hansch et al. 1995)
- 6.10 (calculated, Passivirta et al. 1999)
- 6.00, 5.91 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ as or as indicated and reported temperature dependence equations:

- 7.90 (calculated- K_{OW}/K_{AW} , Wania & Mackay 1996)
- 8.22; 7.73 (fugacity meter/generator column-GC; calculated, Kömp & McLachlan 1997a)
- $\log K_{OA} = -6.20 + 4340/(T/K)$; temp range: 10–43°C (fugacity meter, Kömp & McLachlan 1997a)
- 9.10 (10°C, estimated, Thomas et al. 1998)
- 9.46, 8.49; 8.56 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
- 8.33 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)
- 8.47; 8.44 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)
- 8.22, 8.22 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)
- $\log K_{OA} = 4251/(T/K) - 6.04$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, $\log \text{BCF}$:

- 3.87 (oyster, Vreeland 1974; quoted, Hawker & Connell 1986)
- 4.26, 4.60, 4.02, 4.07 (algae, snail, mosquito, fish, Metcalf et al. 1975)
- 2.66 (green sunfish, 15 d in static water, Sanborn et al. 1975)
- 6.21; 6.07 (goldfish, 3% lipid; 10% lipid dry wet in food, static equilibration system-GC/ECD, 23-d exposure, Bruggeman et al. 1981)
- 6.38 (guppy, 3.5% lipid, Bruggeman et al. 1982, 1984; quoted, Gobas et al. 1987)
- 4.69, 4.98 (goldfish, exptl., correlated, Mackay & Hughes 1984)
- 3.49–4.26 highest value 4.26, not equilibrated (rainbow trout, 15°C, steady-state BCF of 7- to 96-d laboratory study, Oliver & Niimi 1985)
- 5.30, 4.26; 6.28 (rainbow trout, laboratory data: kinetic BCF (k_1/k_2), steady state BCF (C_F/C_W); Lake Ontario field BCF, Oliver & Niimi 1985)
- 4.26, 4.69 (guppy, goldfish, calculated- C_B/C_W , or k_1/k_2 , Connell & Hawker 1988; Hawker 1990)
- 4.26 (fish, quoted, Isnard & Lambert 1988, 1989)
- 6.38; 5.76 (guppy, lipid wt. based, corrected lipid wt. based, Gobas et al. 1989)
- 4.25 (guppy, estimated, Banerjee & Baughman 1991)
- 6.21; 6.32 (lipid basis: goldfish; rainbow trout, Noegrohati & Hammers 1992)
- 4.54, 6.02; 4.782, 4.708 (quoted-whole fish, fish lipid; calculated-molecular connectivity indices, K_{OW} , Lu et al. 1999)
- 3.08–4.58 (various marine species, mean dry wt. BCF, Hope et al. 1998)
- 4.86–6.31 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)
- 5.23 (Baltic Sea blue mussels, flow-through exptl, dry wt., Gustafsson et al. 1999)
- 5.03, 4.67; 3.57, 4.76, 4.17, 5.39 (oligochaetes; chironomid larvae, Bott & Standley 2000)
- 3.36, 5.60 (*Daphnia*, 21-d renewal: wet wt basis, lipid wt basis, Geyer et al. 2000)
- 3.87, 6.12 (oyster: wet wt basis, lipid wt basis, Geyer et al. 2000)

- 4.28, 6.23 (mussel *Mytilus edulis*: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.42, 6.34 (mussel: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.63, 5.93 (guppy: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.69, 5.99 (goldfish: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.92, 6.46 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.01; 3.89 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Bioaccumulation Factor, log BAF at 25°C or as indicated:

- 7.38 (rainbow trout, lipid based-L/kg(Ip), quoted, Thomann 1989)
 4.92; 6.43 (22°C, zebrafish: log BCF_w wet wt basis; log BCF_L lipid wt basis, Fox et al. 1994)

Partition Coefficient between particulate and dissolved contaminant concentrations, log K_p or log K_d

- 5.60, 4.90 (Lake Superior suspended solids, concn ratio-GC/ECD, Baker et al. 1986)
 5.30 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
 4.73–5.15 (field-generated particulates, New Bedford Harbor, Bergen et al. 1993)

Sorption Partition Coefficient, log K_{OC} at 25°C or as indicated:

- 4.67 (Woodburn soil silt loam, sorption isotherm measurement, Haque & Schmedding 1976)
 5.91 (suspended particulate matter, calculated-K_{OW}, Burkhard 1984)
 5.60; 5.50; 5.70 (field data of sediment trap material; Niagara River-organic matter; calculated-K_{OW}, Oliver & Charlton 1984)
 4.54, 4.42 (Aldrich humic acid with 9.4 mg/L DOC: reversed-phase separation, equilibrium dialysis, Landrum et al. 1984)
 3.87, 4.36 (Huron River water with 7.8 mg/L DOC: reversed-phase separation, equilibrium dialysis, Landrum et al. 1984)
 4.87 (dissolved humic acid, gas purging-LSC, Hassett & Milicic 1985)
 5.35 (suspended solids-Lake Superior; field measurement-GC/ECD, Baker et al. 1986)
 5.70, 4.87 (Lake Superior suspended solids: calculated-K_{OW}, Baker et al. 1986)
 6.15 (Composite Condie silt soil 0.36% OC, batch sorption equilibrium, Anderson & Pankow 1986)
 5.0–6.4, 5.9 (suspended sediment, range, average, Oliver 1987a)
 6.12 (Lake Michigan water column, Swackhamer & Armstrong 1987)
 4.65 (calculated, Bahnick & Doucette 1988)
 3.48 (12 lakes/streams in southern Ontario at 1.6–26.5 mg/L DOC, Evans 1988)
 4.35 (calculated-polymaleic acid, Chin & Weber 1989)
 5.88 (calculated after Karickhoff et al. 1979, Capel & Eisenreich 1990)
 4.88 (calculated after Schwarzenbach & Westall 1981, Capel & Eisenreich 1990)
 5.83 (organic carbon from total suspended matter of raw water from Lake Michigan, Eadie et al. 1990)
 5.00, 3.88 (Aldrich humic acid, natural DOC, reversed-phase separation, Eadie et al. 1990)
 5.00; 4.38–4.81; 2.89–3.93 (Aldrich humic acid; humic acid from soil & water samples; fulvic acid & dissolved organic matter samples, Jota & Hassett 1991)
 6.0 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
 5.41 (soil, batch sorption equilibration-GC, Paya-Perez et al. 1991)
 6.04, 4.80 (Hamlet City lake sediment, WES reference soil, batch sorption equilibrium, Brannon et al. 1995)
 4.73 (Ispra oil, calculated-MCI 'χ, Sabljic et al. 1995)
 5.02, 6.04; 4.80 (sediments from Brown's Lake, Hamlet City Lake; WES reference soil, shake flask-HPLC/fluorescence, Brannon et al. 1995)
 4.97; 5.09 (soil, quoted lit.; calculated-QSPR Characteristic Root Index CRI, Saçan & Balcioglu 1996)
 5.30–5.41 (soil-Catlin silt loam, f_{OC} = 0.0226, depth 0–15 cm, batch equilibrium-GC, Girvin & Scott 1997)
 5.61–5.65 (Cloudland loam, f_{OC} = 0.0024, depth 15–30 cm, batch equilibrium-GC, Girvin & Scott 1997)
 5.30–5.31 (Kenoma silt loam, f_{OC} = 0.0153, depth 0–20 cm, batch equilibrium-GC, Girvin & Scott 1997)
 5.38 (Kenoma silt loam, f_{OC} = 0.0092, depth 58–82 cm, batch equilibrium-GC, Girvin & Scott 1997)
 5.43–5.53 (Kenoma silt loam, f_{OC} = 0.002, depth 120–155 cm, batch equilibrium-GC, Girvin & Scott 1997)
 5.26–5.44 (Norborne silt loam, f_{OC} = 0.0137, depth 0–20 cm, batch equilibrium-GC, Girvin & Scott 1997)

- 5.24–5.36 (Norborne silt loam, $f_{OC} = 0.009$, depth 33–65 cm, batch equilibrium-GC, Girvin & Scott 1997)
 5.39–5.40 (Norborne silt loam, $f_{OC} = 0.0057$, depth 65–85 cm, batch equilibrium-GC, Girvin & Scott 1997)
 5.50 (soil, calculated- K_{OW} , Girvin & Scott 1997)
 5.50; 4.90 (soil, calculated-universal solvation model; quoted lit., Winget et al. 2000)
 4.98 (sediment, Bott & Standley 2000)
 5.02, 4.55 (soils: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, average, Delle Site 2001)
 5.58 (sediment: organic carbon $OC \geq 0.5\%$, average, Delle Site 2001)
 3.79–6.07; 4.40–6.40 (range, calculated from sequential desorption of 11 urban soils; lit. range, Krauss & Wilcke 2001)
 5.32; 5.52, 5.38, 5.60 (20°C, batch equilibrium, A2 alluvial grassland soil; calculated values of expt 1,2,3-solvophobic approach, Krauss & Wilcke 2001)

Sorption Partition Coefficient, $\log K_{OM}$:

- 4.67 (Haque & Schmedding 1976; Chou & Griffin 1986)
 4.67, 4.62 (quoted, calculated-MCI χ , Sabljic 1984)
 3.88 (Great Lake DOC, reversed-phase separation, Eadie et al. 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2}$ (exptl) = 2.8 h of evaporation from an initial concentration of 0.005 ppm in a glass dish of 4.5 cm depth of water solution at 24°C and $t_{1/2} = 0.68$ h with stirring of the solution (Chiou et al. 1979); depletion $k = 34$ d⁻¹ from a 26-cm or 67-cm height purge vessels. from aqueous solution (Girvin et al. 1997).

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.4\text{--}0.9) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60$ d, due to gas-phase loss process at room temp. (Atkinson 1987)
 $k_{OH}(\text{calc}) = (0.36\text{--}1.7) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40$ d at room temp. (Kwok et al. 1995)

Biodegradation: microbial degradation with pseudo first-order rate constant $k = 0.1$ yr⁻¹ in the water column and $k = 1.0$ yr⁻¹ in the sediment (Furukawa et al. 1978; quoted, Neely 1981).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_2 = 0.008$ d⁻¹ (11°C, rainbow trout, Guiney et al. 1977; quoted, Waid 1986)
 $k_2 = 0.003$ d⁻¹ (10–11°C, rainbow trout eggs and sac fry, Guiney et al. 1980; quoted, Waid 1986)
 $k_1 = 740$ d⁻¹; $k_2 = 0.015$ d⁻¹ (23°C, goldfish, 3% lipid content, Bruggeman et al. 1981; quoted, Waid 1986; Clark et al. 1990)
 $k_1 = 280$ d⁻¹; $k_2 = 0.0014$ d⁻¹ (rainbow trout, Oliver & Niimi 1985)
 $k_1 = 1200$ d⁻¹; $k_2 = 0.015$ d⁻¹ (guppy, Bruggeman et al. 1984)
 $k_2 = 0.015, 0.0134$ d⁻¹ (goldfish, exptl., correlated, Mackay & Hughes 1984)
 $k_1 = 2800$ d⁻¹; $k_2 = 0.0014$ d⁻¹ (rainbow trout, Oliver & Niimi 1985)
 $k_1 = 30.8$ h⁻¹; $1/k_2 = 1600$ h (goldfish, quoted, Hawker & Connell 1985)
 $k_1 = 50.0$ h⁻¹; $1/k_2 = 1600$ h (guppy, quoted, Hawker & Connell 1985)
 $k_1 = 1100$ d⁻¹ (guppy, Opperhuizen 1986)
 $\log k_1 = 2.87$ d⁻¹; $\log 1/k_2 = 1.82$ d (fish, quoted, Connell & Hawker 1988)
 $\log 1/k_2 = 2.9, 3.0$ h (fish, quoted, calculated- K_{OW} , Hawker & Connell 1988b).
 $1/k_2 = 30.3$ d (guppy, quoted, Clark et al. 1990)
 $1/k_2 = 61.7, 102$ d (guppy, Gobas et al. 1989; quoted, Clark et al. 1990)
 $k_1 = 3230$ d⁻¹; $k_2 = 0.0387$ d⁻¹ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)
 $k_2 = 0.011$ d⁻¹ with $t_{1/2} = 65$ d and $k_2 = 0.018$ d⁻¹ with $t_{1/2} = 39$ d for food concn of 22 ng/g and 125 ng/g, respectively in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)
 $k_1 = 20$ L d⁻¹ g⁻¹ dry wt.; $k_2 = 0.118$ d⁻¹ (Baltic Sea blue mussels, flow-through experiment., Gustafsson et al. 1999)

$k_1 = 0.00061 \text{ h}^{-1}$; $k_2 = 0.0115 \text{ h}^{-1}$ (blood plasma of ring doves, Drouillard & Norstrom 2000)
 $k_1(\text{calc}) = 9 \text{ (food lipid mg)/(g worm lipid-d)}$; $k_2(\text{calc}) = 0.09 \text{ d}^{-1}$ (earthworm, Wågman et al. 2001)
 $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 158 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 196 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)
 $k_2 = 0.015 \text{ d}^{-1}$ with $t_{1/2} = 46.2 \text{ d}$ (juvenile carp in 100-d experiment Stapleton et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);
 tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1996);

$t_{1/2} = 1500 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: $t_{1/2} = 19.7 \text{ d}$ in Lake Michigan (Neely 1983);

$t_{1/2} = 30000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: $t_{1/2} = 87600 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: Sorption-Desorption Rate Constants: release rate constants k_d for labile PCBs sorbed to utility substation soils are: $k = 0.27 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.99 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 1.30 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.39 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from first day gas-purge experiments; release rate constants k_d for nonlabile PCBs sorbed to utility substation soils are: $k = 0.00112 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.00251 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 0.00174 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.00127 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from 120–195 d experiments (Girvin et al. 1997).

$t_{1/2} = 87600 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: $t_{1/2} = 1.76 \text{ yr}$ in female rainbow trouts, $t_{1/2} = 1.43 \text{ yr}$ in males (Guiney et al. 1980);

$t_{1/2} = 500 \text{ d}$ in rainbow trout (Niimi & Oliver 1983; Oliver & Niimi 1985); and $t_{1/2} = 99 \text{ d}$ in its muscle, (Niimi & Oliver 1983);

$t_{1/2} = 46 \text{ d}$ in guppy (Bruggeman et al. 1984);

$t_{1/2} = 43 \text{ d}$ in worms at 8°C , 43 d (Oliver 1987c)

depuration $t_{1/2} = 39\text{--}65 \text{ d}$ in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

theoretical half-life to reach 90% steady-state tissue concn 5.9 d (Baltic Sea blue mussels, flow-through expt., Gustafsson et al. 1999);

$t_{1/2} = 6.0 \text{ h}$ in blood plasma (ring doves, Drouillard & Norstrom 2000)

elimination $t_{1/2} = 8 \text{ d}$ in earthworm given contaminated food (predicted, Wågman et al. 2001).

depuration $t_{1/2} = 158 \text{ d}$ for high-dose treatment, $t_{1/2} = 196 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

depuration $t_{1/2} = 46.2 \text{ d}$ for juvenile carp in 100-d experiment (Stapleton et al. 2004)

TABLE 7.1.1.52.1
Reported vapor pressures and Henry's law constants of 2,2',5,5'-tetrachlorobiphenyl (PCB-52) at various temperatures and temperature dependence equations

Vapor pressure		Henry's law constant

FIGURE 7.1.1.52.1 Logarithm of vapor pressure and Henry's law constant versus reciprocal temperature for 2,2',5,5'-tetrachlorobiphenyl (PCB-52).

7.1.1.53 2,2',5,6'-Tetrachlorobiphenyl (PCB-53)

Common Name: 2,2',5,6'-Tetrachlorobiphenyl

Synonym: PCB-53, 2,2',5,6'-tetrachloro-1,1'-biphenyl

Chemical Name: 2,2',5,6'-tetrachlorobiphenyl

CAS Registry No: 41464-41-9

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

103–104.5 (Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

211.6 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.168 (mp at $104^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.0923 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985b)

0.109 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.0945, 0.0786, 0.0717, 0.0335 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.0476 (generator column-GC/ECD, Dunnivant & Elzerman 1988)

0.288 (supercooled liquid S_L , calculated-mp, Dunnivant & Elzerman 1988)

0.292 (calculated-TSA, Abramowitz & Yalkowsky 1990)

0.044 (calculated-MCI χ , Patil 1991)

0.0520 (calculated-QSPR, Dunnivant et al. 1992)

0.0306 (calculated-group contribution, Kühne et al. 1995)

0.0114, 0.0306 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

0.114 (calculated-mp and K_{ow} , Ran et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.00493 (Neely 1983; quoted, Erickson 1986)

0.0273 (supercooled liquid P_L , GC-RT correlation, Bidleman 1984)

0.0356 (supercooled liquid P_L , GC-RT correlation, Burkhard 1984)

0.0372 (GC-RI correlation, Burkhard et al. 1985a)

0.0356 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.0268, 0.0331 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.011 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.00671; 0.0405 (calculated- $S \times HLC$, solid P_S ; supercooled liquid P_L , Dunnivant & Elzerman 1988)

$\log(P/mmHg) = 10.40 - 4310/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.0214, 0.0347 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/a) = -4114/(T/K) + 12.24$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

0.0162 ($20^{\circ}C$, supercooled liquid P_L , from Falconer & Bidleman 1994. Harner & Bidleman 1996)

0.00161–0.0204; 0.0107–0.0385 (literature P_S range; literature P_L range, Delle Site 1997)

0.00955 (P_L , calculated-MCI $^3\chi$ and Characteristic Root Index [CRI], reported as 2,2',5,6- Saçan & Balcioglu 1998)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C as indicated):

- 30.40 (calculated-P/C, Murphy et al. 1983)
 - 112.5 (calculated-P/C, Burkhard et al. 1985b)
 - 28.67 (20°C , calculated-P/C, Murphy et al. 1987)
 - 41.14 (batch stripping-GC, Dunnivant & Elzerman 1988; Dunnivant et al. 1988)
 - 47.26 (calculated-molecular connectivity indices, Sabljic & Güsten 1989)
 - 43.62 (calculated-QSPR, Dunnivant et al. 1992)
 - 17.21 (calculated-QSPR, Achman et al. 1993)
 - 44.8 (predicted from homolog group and ortho-Cl, Bamford et al. 2002)
- $\ln K_{\text{AW}} = -\Delta H_{\text{H}}/RT + \Delta S_{\text{H}}/R$; R is the ideal gas constant, $\Delta H_{\text{H}} = 25 \pm 2 \text{ kJ/mol}$, $\Delta S_{\text{H}} = 0.05 \pm 0.01 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

- 5.96 (calculated-TSA, Burkhard 1984)
- 5.90 (calculated-regression analysis with chlorine substituents, Oliver 1987c)
- 5.39, 5.57, 5.43, 5.80 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 5.46 (generator column-GC, Hawker & Connell 1988a)
- 5.62 (calculated-TSA, Hawker & Connell 1988a)
- 5.87 (calculated-MCI χ , Patil 1991)
- 5.55 (recommended, Sangster 1993)
- 7.8733 (calculated-UNIFAC group contribution, Chen et al. 1993)
- 5.98 (quoted, Hansch et al. 1995)
- 6.12, 5.55–5.90 (calculated-Characteristic Root Index CRI, min.-max. range, Saçan & Inel 1995)
- 5.4429 (calculated-molecular properties MNDO-AM1 method, Makino 1998)
- 6.13 (calculated-CLOGP ver. 4, Ran et al. 2002)
- 5.67 (calculated-QSPR, Yeh & Hong 2002)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$ at 25°C or as indicated and reported temperature dependence equations.

- 9.28, 8.70, 8.24, 7.64 (0, 10, 20, 30°C , generator column-GC, Harner & Mackay 1995)
- $\log K_{\text{OA}} = -5.26 + 3965/(T/K)$; temp range 0 – 30°C (generator column-GC, Harner & Bidleman 1996)
- 9.18, 8.18; 8.25 (0, 20°C , multi-column GC- k' correlation; calculated at 20°C , Zhang et al. 1999)
- 8.02 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

- 5.76 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}}(\text{calc}) = (0.4\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{\text{OH}}(\text{aq.}) = 5.7 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C , half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{\text{OH}}(\text{calc}) = (0.36\text{--}1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Biodegradation: 91% degradation at 24 h in one of the PCB mixture including congeners ranging from di- to hexa-PCBs with several structure classes, by microorganism *Alcaligenes eutrophus* H850 (Bedard et al. 1986).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.0019 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; selected, Clark et al. 1990)

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 91 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 88 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991)

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} = 365 \text{ d}$ in rainbow trout, d and $t_{1/2} = 107 \text{ d}$ in its muscle 107 d (Niimi & Oliver 1983);

$t_{1/2} = 30 \text{ d}$ in worms at 8°C, 30 d (Oliver 1987c).

depuration $t_{1/2} = 91 \text{ d}$ for high-dose treatment, $t_{1/2} = 88 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.54 2,2',6,6'-Tetrachlorobiphenyl (PCB-54)

Common Name: 2,2',6,6'-Tetrachlorobiphenyl

Synonym: PCB-54, 2,2',6,6'-tetrachloro-1,1'-biphenyl

Chemical Name: 2,2',6,6'-tetrachlorobiphenyl

CAS Registry No: 15968-05-5

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

198 (Van Roosmalen 1934; Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

211.6 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0201 (mp at $198^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.412, 0.221, 0.143, 0.0882 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.0027 ($22^{\circ}C$, generator column-GC/ECD, Opperhuizen et al. 1988)

0.0119 (generator column-GC/ECD, Dunnivant & Elzerman 1988)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0659 (supercooled liquid P_L , Burkhard 1984)

0.00132 (GC-RI correlation, Burkhard et al. 1985a)

0.0659 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.0392, 0.0517 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.0566 (supercooled liquid P_L , Dunnivant & Elzerman 1988)

0.00227; 0.118 (calculated- $S \times HLC$, P_S ; supercooled liquid P_L , Dunnivant & Elzerman 1988)

$\log(P_L/Pa) = -3751/(T/K) + 11.17$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

0.000396–0.0219; 0.00388–0.104 (literature P_S range; literature P_L range, Delle Site 1997)

0.0114 (P_L , calculated-MCI $^3\chi$ and Characteristic Root Index [CRI], Saçan & Balcioglu 1998)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

188.5 (calculated-P/C, Burkhard et al. 1985b)

15.0 (calculated, Coates & Elzerman 1986)

55.73 (batch stripping-GC/ECD, Dunnivant & Elzerman 1988; Dunnivant et al. 1988)

50.0 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

20.27 (wetted-wall column-GC/ECD, Brunner et al. 1990)

50.04 (calculated-QSPR, Dunnivant et al. 1992)

44.8 (estimated based on homolog group and ortho chlorine number, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 25 \pm 2$ kJ/mol, $\Delta S_H = 0.05 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.63 (calculated after Rekker 1977, Könemann 1981)

4.16, 713, 7.01 (HPLC- k' correlation; calculated- π const.; calculated-fragment const., McDuffie 1981)

- 5.94 (RP-TLC-retention, Bruggeman et al. 1982)
 4.95, 5.27, 5.22, 5.52 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 5.48 (generator column-GC, Hawker & Connell 1988a)
 5.936 \pm 0.031 (slow stirring-GC, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
 5.24 (recommended, Sangster 1993)
 5.94 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 7.30 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 3.85; 5.38 (zebrafish: $\log BCF_w$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.106, 4.91, 4.89, 4.72 (bottom sediments of: Oconee River pH 6.5, USDA Pond pH 6.4, Doe Run Pond pH 6.1, Hickory Hill Pond pH 6.3, batch equilibration-GC, Steen et al. 1978)
 5.72 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 5.63 (river sediment, Coates & Elzerman 1986)
 4.79 (correlated literature values in soils, Sklarew & Girvin 1987)
 5.01 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
 5.11; 5.01 (soil, quoted lit.; calculated-Characteristic Root Index [CRI], Saçan & Balcioglu 1996)
 4.91, 4.84 (sediments: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, average, Delle Site 2001)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25-60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.36 - 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5-40 \text{ d}$ at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

$k_1 = 2740 \text{ d}^{-1}$; $k_2 = 0.387 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 190 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.007 \text{ d}^{-1}$ with $t_{1/2} = 100 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);
 tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water: photodegradation $t_{1/2} = 72.5 \text{ min}$ when irradiated in a TiO_2 semiconductor aqueous suspensions with a 1.5 kW high pressure Xenon lamp (De Felip et al. 1996).

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 190 \text{ d}$ for high-dose treatment, $t_{1/2} = 100 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.55 2,3,3',4-Tetrachlorobiphenyl (PCB-55)

Common Name: 2,3,3',4-Tetrachlorobiphenyl

Synonym: PCB-55, 2,3,3',4-tetrachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4-tetrachlorobiphenyl

CAS Registry No: 74338-24-2

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

89 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.122 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0184 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

4.81×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00517 (GC-RI correlation, Burkhard et al. 1985b)

0.00579, 0.00349 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -4382/(T/K) + 12.46$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

11.55 (calculated-P/C, Burkhard 1984)

23.51 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

18.48 (calculated-QSPR, Dunnivant et al. 1992)

35.1 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 28 \pm 2$ kJ/mol, $\Delta S_H = 0.06 \pm 0.01$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.86 (calculated-TSA, Burkhard 1984)

6.11 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.0161 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.00 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

5.66 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Life, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference: $k_{OH}(\text{calc}) = (0.4\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987) $k_{OH}(\text{calc}) = (0.36\text{--}1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2): $k_2 = 0.008 \text{ d}^{-1}$ with $t_{1/2} = 91 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004) $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 157 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 91 \text{ d}$ for high-dose treatment, $t_{1/2} = 157 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.56 2,3,3',4'-Tetrachlorobiphenyl (PCB-56)

Common Name: 2,3,3',4'-Tetrachlorobiphenyl

Synonym: PCB-56, 2,3,3',4'-tetrachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4'-tetrachlorobiphenyl

CAS Registry No: 41464-41-9

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

95 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.122 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0389 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.0989 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.0146 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.0115 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

3.96×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00517 (GC-RI correlation, Burkhard et al. 1985b)

0.00434, 0.00327 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

2.17×10^{-3} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.00331, 0.00468 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4382/(T/K) + 12.33$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant (Pa- m^3/mol at $25^{\circ}C$ or as indicated):

9.45 (calculated-P/C, Burkhard 1984)

16.41 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

13.27 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

15.34 (calculated-QSAR, Dunnivant et al. 1992)

8.24 (calculated-QSAR, Achman et al. 1993)

35.0 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 27 \pm 2$ kJ/mol, $\Delta S_H = 0.05 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004
Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.84 (calculated, Burkhard 1984)

5.95 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

5.8476 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.65 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:Sorption Partition Coefficient, $\log K_{OC}$:

5.64 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k, and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}}(\text{calc}) = (0.4\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{\text{OH}}(\text{calc}) = (0.36\text{--}1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 132 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 135 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 132 \text{ d}$ for high-dose treatment, $t_{1/2} = 135 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.60 2,3,4,4'-Tetrachlorobiphenyl (PCB-60)

Common Name: 2,3,4,4'-Tetrachlorobiphenyl

Synonym: PCB-60, 2,3,4,4'-tetrachloro-1,1'-biphenyl

Chemical Name: 2,3,4,4'-tetrachlorobiphenyl

CAS Registry No: 33025-41-1

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

128 (Weast 1972–73; Ruelle & Kesselring 1997)

142 (Saeki et al. 1971; Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.2024

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

211.6 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

0.0695 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.058 (shake flask-GC/ECD, Wallnöfer et al. 1973; Hutzinger et al. 1974)

0.0168 (calculated-TSA, Mackay et al. 1980)

0.121 (calculated-TSA, supercooled liquid S_L , Burkhard et al. 1985b)

0.0389 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.0902, 0.0485, 0.0254, 0.0243 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.0359, 0.0273 (Nirmalakhandan & Speece 1989)

0.0146 (calculated-TSA, Abramowitz & Yalkowsky 1990)

0.045 (calculated-MCI χ , Patil 1991)

0.00274 (calculated-QSPR, Dunnivant et al. 1992)

0.0067, 0.0176 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.000319 (GC-RI correlation, Burkhard et al. 1985a)

0.00427 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.00527, 0.00414 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.00217 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

$\log(P/mmHg) = 10.90 - 4660/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.00331, 0.00458 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4282/(T/K) + 12.42$ (supercooled liquid P_L , GC-RT correlation, Falconer Bidleman 1994)

0.0157 (supercooled liquid P_L , calculated-MCI $^3\chi$ and Characteristic Root Index CRI, Saçan & Balcioglu 1998)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$):

84.20 (batch stripping, Atlas et al. 1982)

10.34 (calculated-P/C, Burkhard et al. 1985b)

16.41 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

- 15.40 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)
 15.48 (calculated-QSPR, Dunnivant et al. 1992)
 35.1 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 28 \pm 3$ kJ/mol, $\Delta S_H = 0.06 \pm 0.01$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 5.87 (calculated-TSA, Burkhard 1984)
 5.84 (HPLC-RT correlation calculated- π , Rapaport & Eisenreich 1984)
 5.90 (selected, Shiu & Mackay 1986)

		$\Delta H_{\text{subl}}/(\text{kJ mol}^{-1}) = 88.7$			

FIGURE 7.1.1.61.1 Logarithm of mole fraction solubility, vapor pressure and K_{OA} versus reciprocal temperature for 2,3,4,5-tetrachlorobiphenyl (PCB-61).

7.1.1.62 2,3,4,6-Tetrachlorobiphenyl (PCB-62)

Common Name: 2,3,4,6-Tetrachlorobiphenyl

Synonym: PCB-62

Chemical Name: 2,3,4,6-tetrachlorobiphenyl

CAS Registry No: 54230-23-7

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

77 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.151 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0463 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0158 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.0167 (GC-RI correlation, Burkhard et al. 1985b)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

30.70 (calculated-P/C, Burkhard 1984)

37.08 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

21.28 (wetted-wall column-GC, Brunner et al. 1990)

37.47 (calculated-QSPR, Dunnivant et al. 1992)

35.0 (predicted from homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 27 \pm 2 kJ/mol$, $\Delta S_H = 0.05 \pm 0.01 kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.79 (calculated, Burkhard 1984)

5.89 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.0323 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.81 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

5.59 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference: $k_{OH}(\text{calc}) = (0.4\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987) $k_{OH}(\text{calc}) = (0.36\text{--}1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.63 2,3,4',5-Tetrachlorobiphenyl (PCB-63)

Common Name: 2,3,4',5-Tetrachlorobiphenyl

Synonym: PCB-63, 2,3,4',5-tetrachloro-1,1'-biphenyl

Chemical Name: 2,3,4',5-tetrachlorobiphenyl

CAS Registry No: 74472-34-7

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

83 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.105 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0263 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.0496 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.0184 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.00727 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

6.36×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00681 (GC-RI correlation, Burkhard et al. 1985b)

2.64×10^{-3} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.00724 (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4382/(T/K) + 12.53$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant (Pa- m^3/mol at $25^{\circ}C$ or as indicated):

17.73 (calculated-P/C, Burkhard 1984)

29.28 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

29.60 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

8.24 (calculated-QSAR, Achman et al. 1993)

25.59 (calculated-QSPR, Dunnivant et al. 1992)

24.5 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

42.1 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 25 \pm 2$ kJ/mol, $\Delta S_H = 0.05 \pm 0.01$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.91 (calculated-TSA, Burkhard 1984)

6.10 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

6.17 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.10 (recommended, Sangster 1993)

6.1262 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

10.15, 9.06 (0, 20°C, multi-column GC-k' correlation, Zhang et al. 1999)

8.81 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

5.71 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.36\text{--}1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 219 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 172 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 219 \text{ d}$ for high-dose treatment, $t_{1/2} = 172 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.64 2,3,4',6-Tetrachlorobiphenyl (PCB-64)

Common Name: 2,3,4',6-Tetrachlorobiphenyl

Synonym: PCB-64, 2,3,4',6-tetrachloro-1,1'-biphenyl

Chemical Name: 2,3,4',6-tetrachlorobiphenyl

CAS Registry No: 52663-58-8

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

57 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

0.00569, 0.00507 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.00252 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

$\log(P/mmHg) = 10.90 - 4650/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.00427, 0.0059 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4349/(T/K) + 12.38$ (GC-RT correlation, Falconer & Bidleman 1994)

0.00347 (supercooled liquid P_L , from Falconer & Bidleman 1994, Harner & Bidleman 1996)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section.):

84.20 (calculated-P/C, Murphy et al. 1983)

13.68 (calculated-P/C, Burkhard et al. 1985b)

- 14.18 (quoted, Eisenreich 1987)
 20.37 (20°C, calculated-P/C, Murphy et al. 1987)
 25.84 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)
 12.16 (wetted-wall column-GC, Brunner et al. 1990)
 20.55 (calculated-QSPR, Dunnivant et al. 1992)
 36.97* \pm 0.48 (gas stripping-GC, measured range 4–31°C, Bamford et al. 2000)
 $\ln K_{AW} = 7.4573 - 3488.7/(T/K)$; temp range 4–31°C (gas stripping-GC, Bamford et al. 2000)
 $K_{AW} = \exp[-(29.0/kJ \cdot mol^{-1})/RT] + (0.062/kJ \cdot mol^{-1} \cdot K^{-1})/R$; where $R = 8.314 J \cdot K^{-1} \cdot mol^{-1}$ and temp range: 4–31°C, (gas stripping-GC, Bamford et al. 2000)
 35.4 (exptl. data, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 29 \pm 3$ kJ/mol, $\Delta S_H = 0.06 \pm 0.01$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 5.90 (HPLC-RT correlation, Shaw & Connell 1982)
 5.80, 6.31 (HPLC-RT correlation, Rapaport & Eisenreich 1984)
 5.98 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)
 6.31 (generator column-GC/ECD, Hawker & Connell 1988a)
 6.09 (generator column-GC, Larsen et al. 1992)
 6.12 (recommended, Sangster 1993)
 6.31 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

- 9.22* (20°C, generator column-GC, measured range 0–30°C, Harner & Bidleman 1996)
 $\log K_{OA} = -3.82 + 3827/(T/K)$; temp range 0–30°C (generator column-GC, Harner & Bidleman 1996)
 9.73 (10°C, estimated, Thomas et al. 1998)
 10.33, 9.29; 9.22 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 9.36 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 4.45 (worms, Oliver 1987c)
 3.18–4.62 (various marine species, mean dry wt. BCF, Hope et al. 1998)
 4.55–5.76 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

- 5.80, 4.90 (Lake Superior suspended solids, concn ratio-GC/ECD, Baker et al. 1986)

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.74 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 4.72 (soil, calculated-S, Chou & Griffin 1986)
 5.23 (calculated after Karickhoff et al. 1979, Capel & Eisenreich 1990)
 4.90 (calculated after Schwarzenbach & Westall 1981, Capel & Eisenreich 1990)
 6.10 (organic carbon, obs., Murray & Andren 1992)
 4.90 (soil, calculated-QSPR Characteristic Root Index [CRI], Saçan & Balçioğlu 1996)
 5.20 (soil, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Hydrolysis:

Photolysis: photodegradation $k = (0.11 \pm 0.02) h^{-1}$ with $t_{1/2} = 7.1$ h in aqueous solution with the presence of diethylamine after exposure to simulated sunlight (Lin et al. 1995).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60$ d, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{\text{OH}}(\text{aq.}) = 5.1 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from $t_{1/2} \sim 4\text{--}11$ d in freshwater systems, $t_{1/2} = 0.1\text{--}10$ d in cloud water, $t_{1/2} > 1000$ d in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{\text{OH}}(\text{calc}) = (0.36 - 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40$ d at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.001 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; selected, Clark et al. 1990)

$k_2 = 0.009 \text{ d}^{-1}$ with $t_{1/2} = 82$ d and $k_2 = 0.013 \text{ d}^{-1}$ with $t_{1/2} = 55$ d for food concn of 21 ng/g and 158 ng/g, respectively in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 164$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 225$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11$ d in freshwater systems, $t_{1/2} = 0.1\text{--}10$ d in cloud water, $t_{1/2} > 1000$ d in oceans for PCBs with as many as 8 chlorines for OH- oxidation (Sedlak & Andren 1991);

photodegradation $t_{1/2} = (7.1 \pm 1.5) \text{ h}$ in aqueous solution with the presence of diethylamine after exposure to simulated sunlight (Lin et al. 1995).

Groundwater:

Sediment:

Soil: Sorption-Desorption Rate Constants: release rate constants k_d for labile PCBs sorbed to utility substation soils are: $k = 0.067 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.75 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 1.18 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.32 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from first day gas-purge experiments; release rate constants k_d for nonlabile PCBs sorbed to utility substation soils are: $k = 0.00081 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.0024 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 0.00443 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.000295 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from 120–195 d experiments (Girvin et al. 1997).

Biota: $t_{1/2} = 670$ d in rainbow trout, and $t_{1/2} = 108$ d its muscle (Niimi & Oliver 1983)

$t_{1/2} = 33$ d in worms at 8°C (Oliver 1987c)

depuration $t_{1/2} = 55\text{--}82$ d in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

depuration $t_{1/2} = 164$ d for high-dose treatment, $t_{1/2} = 225$ d for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

TABLE 7.1.1.66.1

Reported Henry's law constants and octanol-air partition coefficients of 2,3',4,4'-tetrachlorobiphenyl (PCB-66) at various temperatures and temperature dependence equations

Henry's law constant		log K _{OA}			
Bamford et al. 2000		Harner & Bidleman 1996		Zhang et al. 1999	
gas stripping-GC/MS		generator column-GC		multicolumn-GC-k' correlation	
t/°C	H/(Pa m ³ /mol)	t/°C	log K _{OA}	t/°C	log K _{OA}
4	14.17	0	10.21	0	10.33
11	19.80	10	9.65	20	9.29
18	27.25	20	9.22		
25	36.97	30	8.82		
31	47.51				

$\Delta H_{OA}/(\text{kJ mol}^{-1}) = 73.28$

$\ln K_{AW} = -\Delta H/RT + \Delta S/R$		$\log K_{OA} = A + B/T$	
	K _{AW}	A	-3.82
A	7.4573	B	3827
B	3488.09		

enthalpy, entropy change:
 $\Delta H/(\text{kJ}\cdot\text{mol}^{-1}) = 29.0 \pm 2.6$
 $\Delta S/(\text{J}\cdot\text{mol}^{-1}\cdot\text{K}^{-1}) = 62 \pm 8$

FIGURE 7.1.1.66.1 Logarithm of Henry's law constant and K_{OA} versus reciprocal temperature for 2,3',4,4'-tetrachlorobiphenyl (PCB-66).

7.1.1.67 2,3',4,5-Tetrachlorobiphenyl (PCB-67)

Common Name: 2,3',4,5-Tetrachlorobiphenyl

Synonym: PCB-67, 2,3',4,5-tetrachloro-1,1'-biphenyl

Chemical Name: 2,3',4,5-tetrachlorobiphenyl

CAS Registry No: 73575-53-8

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

83 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0987 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0351, 0.0298, 0.00804, 0.0266 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.0184 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.00654 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.0070 (GC-RI correlation, Burkhard et al. 1985b)

$\log(P/mmHg) = 10.70 - 4530/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.00708 (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4382/(T/K) + 12.52$, (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

19.35 (calculated-P/C, Burkhard 1984)

29.18 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

10.13 (wetted-wall column-GC/ECD, Brunner et al. 1990)

23.70 (calculated-QSPR, Dunnivant et al. 1992)

35.1 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 28 \pm 3\ kJ/mol$, $\Delta S_H = 0.06 \pm 0.01\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.93 (calculated-TSA, Burkhard 1984)

6.22, 6.32, 6.40, 6.33 (RP-HPLC- k' correlations, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

6.20 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.32 (recommended, Sangster 1993)

6.2276 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.06 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

5.73 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.36\text{--}1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.68 2,3',4,5'-Tetrachlorobiphenyl (PCB-68)

Common Name: 2,3',4,5'-Tetrachlorobiphenyl

Synonym: PCB-68

Chemical Name: 2,3',4,5'-tetrachlorobiphenyl

CAS Registry No: 73575-52-7

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

71 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

0.0097, 0.0146, 0.0184, 0.0243 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.0583 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0169 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.0179, (GC-RI correlation, Burkhard et al. 1985b)

$\log(P/mmHg) = 10.60 - 4440/T$ (GC-RT correlation, Tateya et al. 1988)

0.01911 (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4229/(T/K) + 12.43$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

47.12 (calculated-P/C, Burkhard 1984)

63.53 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

21.28 (wetted-wall column-GC/ECD, Brunner et al. 1990)

51.22 (calculated-QSAR, Dunnivant et al. 1992)

35.0 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 27 \pm 2$ kJ/mol, $\Delta S_H = 0.05 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.91 (calculated-TSA, Burkhard 1984)

6.09, 6.06, 6.09, 5.89 (RP-HPLC- k' correlations, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

6.04 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.0068 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.47 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

5.71 (suspended particulate matter, Burkhard et al. 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.36\text{--}1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.70 2,3',4',5-Tetrachlorobiphenyl (PCB-70)

Common Name: 2,3',4',5-Tetrachlorobiphenyl

Synonym: PCB-70, 2,3',4',5-tetrachloro-1,1'-biphenyl

Chemical Name: 2,3',4',5-tetrachlorobiphenyl

CAS Registry No: 32598-11-1

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

104 (Bellavita 1935; Hutzinger et al. 1974)

104–107 (Wallnöfer et al. 1973, Bolgar 1973)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.2024

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

211.6 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.168 (mp at $104^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.041 (shake flask-GC/ECD, Wallnöfer et al. 1973; Hutzinger et al. 1974)

0.029 (calculated-TSA, Mackay et al. 1980)

 5.99 (generator column-GC, Larsen et al. 1992)
 5.99 (HPLC- k' correlation, Neogrohati & Hammers 1992)
 5.7833 (calculated-UNIFAC group contribution, Chen et al. 1993)
 6.23 (recommended, Sangster 1993)
 6.23 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

10.29, 9.22; 9.29 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 8.92 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ at 25°C or as indicated:

6.15 (goldfish, 3% lipid, static equilibration system-GC/ECD, 23-d exposure, Bruggeman et al. 1981)
 6.20 (goldfish, 3% lipid, calculated- K_{OW} , Bruggeman et al. 1981)
 4.62, 5.11 (goldfish, exptl., correlated, Mackay & Hughes 1984)
 4.32, 5.50 (guppy, lipid phase, Opperhuizen et al. 1985)
 4.92 (guppy, Gobas et al. 1987)
 4.62, 4.32 (fish, calculated- C_B/C_W or k_1/k_2 , Connell & Hawker 1988; Hawker 1990)
 5.08; 6.61 (22°C, zebrafish: $\log BCF_W$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)
 4.32, 5.62; 4.742, 4.257 (quoted-whole fish, fish lipid; calculated-molecular connectivity indices, K_{OW} , Lu et al. 1999)
 5.08, 6.61 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

5.70, 5.10 (Lake Superior suspended solids, concn ratio-GC/ECD, Baker et al. 1986)

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.02, 4.86, 4.85, 4.69 (bottom sediments of: Oconee River pH 6.5, USDA Pond pH 6.4, Doe Run Pond pH 6.1, Hickory Hill Pond pH 6.3, batch equilibration-GC, Steen et al. 1978)
- 5.73 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
- 5.6–6.8, 6.3 (suspended sediment, average, Oliver 1987a)
- 7.20 (algae > 50 μm , Oliver 1987a)
- 4.81 (soil, calculated-S, Chou & Griffin 1986)
- 4.76 (correlated literature values in soils, Sklarew & Girvin 1987)
- 6.04 (calculated after Karickhoff et al. 1979, Capel & Eisenreich 1990)
- 5.52 (calculated after Schwarzenbach & Westall 1981, Capel & Eisenreich 1990)
- 6.0 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 4.84 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)
- 5.02; 5.07 (soil, quoted lit.; calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)
- 5.30 (soil, calculated- K_{OW} , Girvin & Scott 1997)
- 4.86, 4.80 (sediments: organic carbon $\text{OC} \geq 0.1\%$, $\text{OC} \geq 0.5\%$, average, Delle Site 2001)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 5.5 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C , half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (0.36 - 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 420 \text{ d}^{-1}$; $k_2 = 0.01 \text{ d}^{-1}$ (23°C , goldfish, 3% lipid content, Bruggeman et al. 1981; quoted, Waid 1986, Clark et al. 1990)

$k_2 = 0.01, 0.0104 \text{ d}^{-1}$ (goldfish, exptl., correlated, Mackay & Hughes 1984)

$k_1 = 380 \text{ d}^{-1}$; $k_2 = 0.018 \text{ d}^{-1}$ (guppy, Opperhuizen et al. 1985)

$k_1 = 17.5 \text{ h}^{-1}$; $1/k_2 = 2400 \text{ h}$ (goldfish, quoted, Hawker & Connell 1985)

$\log k_1 = 2.58, 2.62 \text{ d}^{-1}$; $\log 1/k_2 = 1.74, 2.0 \text{ d}$ (fish, quoted, Connell & Hawker 1988)

$\log k_2 = -2.0 \text{ d}^{-1}$ (fish, quoted, Thomann 1989)

$k_1 = 3340 \text{ d}^{-1}$; $k_2 = 0.0280 \text{ d}^{-1}$ (22°C , zebrafish, 30-d exposure, Fox et al. 1994)

$k_1 = 0.00043 \text{ h}^{-1}$; $k_2 = 0.170 \text{ h}^{-1}$ (blood plasma of ring doves, Drouillard & Norstrom 2000)

$k_1 = 10$ (food lipid $\text{mg}/(\text{g worm lipid-d})$; $k_2 = 0.09 \text{ d}^{-1}$ (earthworm, Wågman et al. 2001)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 167 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 217 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of $25\text{--}60 \text{ d}$ due to calculated rate constant of gas-phase reaction with OH radicals for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of $8.5\text{--}40 \text{ d}$ based on the calculated rate constant for gas-phase reaction with OH radicals for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11$ d in freshwater systems, $t_{1/2} = 0.1\text{--}10$ d in cloud water, $t_{1/2} > 1000$ d in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991); photodegradation $t_{1/2} = 4.87$ min when irradiated in a TiO_2 semiconductor aqueous suspensions with a 1.5-kW high pressure Xenon lamp (De Felip et al. 1996)

Groundwater:

Sediment:

Soil:

Biota: clearance $t_{1/2} = 60$ d in goldfish (static equilibration system, 23-d exposure, Bruggeman et al. 1981)

$t_{1/2} = 38.6$ d in guppy (Opperhuizen et al. 1985);

elimination $t_{1/2} = 8$ d in earthworm given contaminated food (Wågman et al. 2001)

depuration $t_{1/2} = 167$ d for high-dose treatment, $t_{1/2} = 217$ d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.71 2,3',4',6-Tetrachlorobiphenyl (PCB-71)

Common Name: 2,3',4',6-Tetrachlorobiphenyl

Synonym: PCB-71

Chemical Name: 2,3',4',6-tetrachlorobiphenyl

CAS Registry No: 41464-46-4

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

57 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 5.5 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C , half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (0.36 - 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 153 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 164 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of $25\text{--}60 \text{ d}$ due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of $8.5\text{--}40 \text{ d}$ based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991)

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 153 \text{ d}$ for high-dose treatment, $t_{1/2} = 164 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.77 3,3',4,4'-Tetrachlorobiphenyl (PCB-77)

Common Name: 3,3',4,4'-Tetrachlorobiphenyl

Synonym: PCB-77, 3,3',4,4'-tetrachloro-1,1'-biphenyl

Chemical Name: 3,3',4,4'-tetrachlorobiphenyl

CAS Registry No: 32598-13-3

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

180 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.2024

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

211.6 (Ruelle & Kesselring 1997; quoted, Passivirta et al. 1999)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

27.10 (Ruelle et al. 1993)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

56.6 (Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F:

0.029 (calculated, assuming $\Delta S_{fus} = 56 J/mol K$, Shiu & Mackay 1986)

0.0202 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.175 (shake flask-GC/ECD, Wallnöfer et al. 1973; Hutzinger et al. 1974)

7.50×10^{-4} (generator column-GC/ECD, Weil et al. 1974)

5.69×10^{-4} * (generator column-GC/ECD, measured $4-32^{\circ}C$, Dickhut et al. 1986)

5.84×10^{-4} * (generator column-GC/ECD, measured range $4-32^{\circ}C$, Dickhut et al. 1986)

$\ln x = -6098/(T/K) - 3.586$, temp range $4-32^{\circ}C$, $\Delta H_{ss} = 50.7 kJ/mol$ (generator column-GC/ECD, Dickhut et al. 1986)

$\log x = -2636/(T/K) - 1.558$, $\Delta H_{ss} = 50.5 kJ/mol$ (regression eq. given by Doucette & Andren 1988, based on exptl data of Dickhut et al. 1986); or

$S/(mol/L) = 3.59 \times 10^{-10} \exp(0.072 \cdot t/^{\circ}C)$ (regression eq. given by Doucette & Andren 1988, based on exptl data of Dickhut et al. 1986)

8.23×10^{-4} , 1.01×10^{-3} , 1.16×10^{-3} (RP-HPLC- k' correlations, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.0018 ($22^{\circ}C$, generator column-GC/ECD, Opperhuizen et al. 1988)

5.50×10^{-4} ; 0.0161 (generator column-GC; supercooled liquid S_L , Dunnivant & Elzerman 1988)

6.10×10^{-4} (generator column-GC/ECD, room temp., Hong & Qiao 1995)

2.02×10^{-3} , 5.44×10^{-3} (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

$\log S_L (mol/L) = -0.246 + 1339/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

$\ln x = -3.58245 - 6074.34/(T/K)$, temp range $5-50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

0.00270* (generator column-GC/ECD, measured range $5-35^{\circ}C$. Huang & Hong 2002).—See Comment by van Noort 2004

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.00219, 0.00196 (supercooled liquid P_L , GC-RT correlation, Bidleman 1984)

0.0014 (supercooled liquid P_L , GT-RT correlation, Burkhard 1984)

5.97×10^{-4} ; 4.46×10^{-5} , 8.04×10^{-4} (calculated-MW, GC-RT correlation, calculated-MCI χ , Burkhard et al. 1985a)
 0.0014 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)
 0.00213, 0.00144 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)
 5.88×10^{-5} ; 0.0020 (selected P_S , supercooled liquid P_L , Shiu & Mackay 1986)
 0.00212 (supercooled liquid P_L , Dunnivant & Elzerman 1988)
 1.82×10^{-5} ; 5.26×10^{-4} (calculated-S \times HLC, solid P_S ; supercooled liquid P_L , Dunnivant & Elzerman 1988)
 0.00141, 0.00191 (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)
 $\log(P_L/P_a) = -4552/(T/K) + 12.61$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)
 1.202×10^{-3} (supercooled liquid P_L , 20°C, from Falconer & Bidleman 1994, Harner & Bidleman 1996)
 6.46×10^{-5} ; 2.21×10^{-3} (solid, supercooled liquid, Passivirta et al. 1999)
 $\log(P_S/P_a) = 15.56 - 5889/(T/K)$ (solid, Passivirta et al. 1999)
 $\log(P_L/P_a) = 12.61 - 4552/(T/K)$ (liquid, Passivirta et al. 1999)
 $(1.82 - 80.4) \times 10^{-5}$; $(4.71 - 22.0) \times 10^{-4}$ (quoted lit. P_S range; lit. P_L range, Delle Site 1997)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

4.37 (calculated-P/C, Burkhard et al. 1985b)
 1.72 (calculated-P/C, Shiu & Mackay 1986)
 9.52 (gas stripping-GC/ECD, Dunnivant et al. 1988; Dunnivant & Elzerman 1988)
 40.88 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)
 10.39 (calculated-QSPR, Dunnivant et al. 1992)
 $\log H$ (Pa m³/mol) = $12.86 - 3214/(T/K)$ (Passivirta et al. 1999)
 $16.20^* \pm 0.41$ (gas stripping-GC, measured range 4–31°C, Bamford et al. 2000)
 $\ln K_{AW} = 11.0657 - 4787.1/(T/K)$; temp range 4–31°C (gas stripping-GC, Bamford et al. 2000)
 $K_{AW} = \exp[-(39.8/\text{kJ}\cdot\text{mol}^{-1})/RT] + (0.092/\text{kJ}\cdot\text{mol}^{-1}\cdot\text{K}^{-1})/R$; where $R = 8.314 \text{ J}\cdot\text{K}^{-1}\cdot\text{mol}^{-1}$ and temp range: 4–31°C (gas stripping-GC, Bamford et al. 2000)
 16.7 (exptl. data, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 40 \pm 6 \text{ kJ/mol}$, $\Delta S_H = 0.09 \pm 0.02 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.04 (HPLC-RT correlation, Sugiura et al. 1979)
 6.52 (RP-TLC-retention, Bruggeman et al. 1982)
 5.62 (HPLC-RT correlation, Rapaport & Eisenreich 1984)
 6.77 (HPLC- k' correlation, De Kock & Lord 1987)
 6.11, 6.40, 6.37 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 6.21 (generator column-GC, Hawker & Connell 1988a)
 6.630 ± 0.018 (slow stirring-GC, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
 6.13 (generator column-GC, Larsen et al. 1992)
 5.98 (HPLC- k' correlation, Noegrohati & Hammers 1992)
 7.8733 (calculated-UNIFAC group contribution, Chen et al. 1993)
 6.11 (recommended, Sangster 1993)
 6.63 (recommended, Hansch et al. 1995)
 6.48 (generator column-GC/ECD, Yeh & Hong 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

9.08 (calculated, Paterson et al. 1991)
 9.96* (20°C, generator column-GC, measured range 0 to 30°C, Harner & Bidleman 1996)
 $\log K_{OA} = -3.14 + 3828/(T/K)$; (temp range 0 to 30°C, Harner & Bidleman 1996)
 10.92, 9.92; 10.03 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)

9.70 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)
 9.29; 9.19 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, log BCF at 25°C or as indicated:

3.46 (killifish, Goto et al. 1978)
 3.90, 3.24, 3.63, 4.15 (golden orfe, carp, brown trout, guppy, Sugiura et al. 1979)
 2.77, 2.63 (human fat in lipid, wet wt. basis, calculated- K_{OW} , Geyer et al. 1987)
 5.36; 6.89 (22°C, zebrafish: log BCF_w wet wt basis; log BCF_L lipid wt basis, Fox et al. 1994)
 4.59, 5.87; 4.745, 4.943 (quoted-whole fish, fish lipid; calculated-molecular connectivity indices, K_{OW} , Lu et al. 1999)
 2.56–4.26 (various marine species, mean dry wt. BCF, Hope et al. 1998)
 4.19–5.23 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)
 5.36 (Baltic Sea blue mussels, flow-through exptl, dry wt., Gustafsson et al. 1999)
 5.36, 6.90 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)
 4.41, 6.37 (mussel *Mytilus edulis*: wet wt basis, lipid wt basis, Geyer et al. 2000)
 2.62, 2.77 (human: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, log K_{OC} :

5.75 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 4.41 (soil, calculated, Chou & Griffin 1986)
 5.02 (soil, calculated-QSPR Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)
 $k_{OH}(\text{calc}) = (0.36 - 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 0.029, 0.0047 \text{ d}^{-1}$ (golden orfe, guppy, Sugiura et al. 1979)
 $k_2 = 0.0157 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)
 $k_1 = 5160 \text{ d}^{-1}$; $k_2 = 0.0224 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)
 $k_1 = 17 \text{ L d}^{-1} \text{ g}^{-1} \text{ dry wt.}$; $k_2 = 0.073 \text{ d}^{-1}$ (Baltic Sea blue mussel, flow-through expt., Gustafsson et al. 1999)
 $k_2 = 0.0251 \text{ d}^{-1}$ with $t_{1/2} = 28 \text{ d}$ (newly contaminated oysters, Gardinali et al. 2004)
 $k_2 = 0.0166 \text{ d}^{-1}$ with $t_{1/2} = 42 \text{ d}$ (chronically contaminated oysters, Gardinali et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);
 tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995);
 $t_{1/2} = 1500 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).
 Surface water: $t_{1/2} = 805 \text{ d}$ in Lake Michigan (Neely 1983);
 photodegradation $t_{1/2} = 528 \text{ min}$ when irradiated in a TiO_2 semiconductor aqueous suspensions with a 1.5-kW high pressure Xenon lamp (De Felip et al. 1996);
 $t_{1/2} = 30000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: $t_{1/2} = 87600$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: $t_{1/2} = 87600$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: $t_{1/2} = 44$ d in rainbow trout, and its muscle, 29 d (Niimi & Oliver 1983);

theoretical half-life to reach 90% steady-state tissue concn 9.5 d (Baltic Sea blue mussels, flow-through expt., Gustafsson et al. 1999)

Depuration $t_{1/2} = 28$ d for newly contaminated oysters, and $t_{1/2} = 42$ d for chronically contaminated oysters (Gardinali et al. 2004)

TABLE 7.1.1.77.1

Reported aqueous solubilities, Henry's law constants and octanol-air partition coefficients of 3,3',4,4'-tetrachlorobiphenyl (PCB 77) at various temperatures and the reported empirical temperature dependence equations

FIGURE 7.1.1.77.1 Logarithm of mole fraction solubility, Henry's law constant and K_{OA} versus reciprocal temperature for 3,3',4,4'-tetrachlorobiphenyl (PCB-77).

7.1.1.78 3,3',4,5-Tetrachlorobiphenyl (PCB-78)

Common Name: 3,3',4,5-Tetrachlorobiphenyl

Synonym: PCB-78

Chemical Name: 3,3',4,5-tetrachlorobiphenyl

CAS Registry No: 70362-49-1

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

94 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0943 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00923 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.00186 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00116, 0.000167, 0.000223 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

0.00319, 0.00206 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -4598/T + 12.92$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

5.76 (calculated-P/C, Burkhard 1984)

22.90 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

21.77 (calculated-QSPR, Dunnivant et al. 1992)

20.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 36 \pm 5$ kJ/mol, $\Delta S_H = 0.08 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.95 (calculated, Burkhard 1984)

6.35 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.2278 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

5.75 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference: $k_{OH}(\text{calc}) = (0.4\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987) $k_{OH}(\text{calc}) = (0.36\text{--}1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2): k_1 : 8 (food lipid mg)/(g worm lipid-d); k_2 : 0.09 d⁻¹ (earthworm, Wågman et al. 2001)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: elimination $t_{1/2} = 7 \text{ d}$ in earthworm given contaminated food (Wågman et al. 2001)

7.1.1.79 3,3',4,5'-Tetrachlorobiphenyl (PCB-79)

Common Name: 3,3',4,5'-Tetrachlorobiphenyl

Synonym: PCB-79

Chemical Name: 3,3',4,5'-tetrachlorobiphenyl

CAS Registry No: 41464-48-6

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

83 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0815 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00923 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.0036 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

2.07×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.0204, 0.00224, 0.00184 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

0.00341, 0.00206 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -4598/(T/K) + 12.95$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

7.39 (calculated-P/C, Burkhard 1984)

11.75 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

3.94 (calculated-QSPR, Achman et al. 1993)

12.73 (calculated-QSAR, Dunnivant et al. 1992)

20.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 36 \pm 5\ kJ/mol$, $\Delta S_H = 0.08 \pm 0.01\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.00 (calculated-TSA, Burkhard 1984)

6.42 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.3035 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.67 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

5.80 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 25\text{--}60 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.36\text{--}1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for tetrachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 8.5\text{--}40 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radical for tetrachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radical for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.80 3,3',5,5'-Tetrachlorobiphenyl (PCB-80)

Common Name: 3,3',5,5'-Tetrachlorobiphenyl

Synonym: PCB-80, 3,3',5,5'-tetrachloro-1,1'-biphenyl

Chemical Name: 3,3',5,5'-tetrachlorobiphenyl

CAS Registry No: 33284-52-5

Molecular Formula: $C_{12}H_6Cl_4$

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

164 (Van Roosmalen 1934; Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.2 (calculated-Le Bas method at normal boiling point)

211.6 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

0.0421 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0712 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985b)

0.000306, 0.000496, 0.000786, 0.000902 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.00124 (generator column-GC/ECD, Dunnivant & Elzerman 1988)

0.0295 (supercooled liquid S_L , calculated-mp, Dunnivant & Elzerman 1988)

0.00292 (calculated-TSA, Abramowitz & Yalkowsky 1990)

2.92×10^{-3} , 7.68×10^{-3} (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

4.96×10^{-3} (calculated-mp and K_{ow} , Ran et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.000859, 0.000139, 0.0219 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985a)

0.00305 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.00547, 0.00511 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -4598/(T/K) + 13.16$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

12.46 (calculated-P/C, Burkhard et al. 1985b)

63.02 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

38.0 (calculated-QSPR, Dunnivant et al. 1992)

20.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 36 \pm 5\ kJ/mol$, $\Delta S_H = 0.08 \pm 0.01\ kJ/mol\ K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.85 (HPLC-RT correlation, Sugiura et al. 1978; quoted, Hansch et al. 1995)

6.58 (RP-TLC-retention, Bruggeman et al. 1982)

45.4 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 30 \pm 6$ kJ/mol, $\Delta S_H = 0.07 \pm 0.02$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.24	(calculated-TSA, Burkhard 1984)
6.26	(calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)
6.51	(calculated, Miertus & Jakus 1990; quoted, Sangster 1993)
6.0458	(calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

10.44, 9.39	(0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
9.01	(calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.04	(suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
4.748	(marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2-0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60-120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3-0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16-48 \text{ d}$ at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 172 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 217 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1996).

Surface water:

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 172 \text{ d}$ for high-dose treatment, $t_{1/2} = 217 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.84 2,2',3,3',6-Pentachlorobiphenyl (PCB-84)

Common Name: 2,2',3,3',6-Pentachlorobiphenyl

Synonym: PCB-84, 2,2',3,3',6-pentachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',6-pentachlorobiphenyl

CAS Registry No: 52663-60-2

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

91 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

$k_{OH}(\text{calc}) = (0.2 - 0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Biodegradation: microbial degradation with pseudo first-order rate constant $k = 0.005 \text{ yr}^{-1}$ in the water column and $k = 0.05 \text{ yr}^{-1}$ in the sediment (Furukawa et al. 1978; quoted, Neely 1981).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 17–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2} = 108 \text{ d}$ in Lake Michigan (Neely 1983).

Groundwater:

Sediment:

Soil:

Biota:

7.1.1.87 2,2',3,4,5'-Pentachlorobiphenyl (PCB-87)

Common Name: 2,2',3,4,5'-Pentachlorobiphenyl

Synonym: PCB-87, 2,2',3,4,5'-pentachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,5'-pentachlorobiphenyl

CAS Registry No: 38380-02-8

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

111.5–113 (Hutzinger et al. 1974; Erickson 1986)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.2803

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

224.5 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.132 (Mackay et al. 1980)

0.138 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.022 (shake flask-GC/ECD, Wallnöfer et al. 1973; Hutzinger et al. 1974)

0.0045 (generator column-GC/ECD, Weil et al. 1974)

0.0294 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.0082, 0.00783, 0.00543, 0.0070 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.00226 (supercooled liquid P_L , GC-RT correlation, Bidleman 1984)

0.000392 (GC-RI correlation, Burkhard et al. 1985a)

0.00141, 0.00262 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.00261, 0.00248 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.00116 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

$\log(P/mmHg) = 11.10 - 4800/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.0017, 0.00275 (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4562/(T/K) + 12.66$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

33.44 (calculated, Murphy et al. 1983)

19.86 (calculated-P/C, Burkhard et al. 1985b)

24.81 (calculated-P/C, Shiu & Mackay 1986)

12.87 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

18.24 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

7.50 (wetted-wall column-GC, Brunner et al. 1990)

18.61 (calculated-QSPR, Dunnivant et al. 1992)

5.966 (calculated-QSPR, Achman et al. 1993)

37.71 ± 0.69 (gas stripping-GC, measured range 4–31°C, Bamford et al. 2000)

12.97, 18.83, 26.86, 37.71, 49.80 (4, 11, 18, 25, 31°C, gas stripping-GC, Bamford et al. 2000)

$\ln K_{AW} = 8.9006 - 3909.07/(T/K)$; temp range 4–31°C (gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(32.5/\text{kJ}\cdot\text{mol}^{-1})/RT] + (0.074/\text{kJ}\cdot\text{mol}^{-1}\cdot\text{K}^{-1})/R$; where $R = 8.314 \text{ J}\cdot\text{K}^{-1}\cdot\text{mol}^{-1}$ and temp range: 4–31°C, (gas stripping-GC, Bamford et al. 2000)

36.5 (exptl. data, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 33 \pm 4 \text{ kJ/mol}$, $\Delta S_H = 0.07 \pm 0.01 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.85 (RP-TLC- k' correlation, Bruggeman et al. 1982)

6.30 (HPLC-RT correlation, Shaw & Connell 1982)

5.45, 6.37 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)

6.63 (calculated-UNIFAC activity coefficients, Banerjee & Howard 1988)

6.14, 6.23, 6.24, 6.27 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

6.36 (HPLC- k' correlation, Noegrohati & Hammers 1992)

6.23 (recommended, Sangster 1993)

6.37 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

9.96 (10°C, estimated, Thomas et al. 1998)

9.25 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ at 25°C or as indicated:

4.43 (oyster, Vreeland 1974)

5.38; 6.91 (22°C, zebrafish: $\log BCF_w$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

5.60, 5.10 (Lake Superior suspended solids, concn ratio-GC/ECD, Baker et al. 1986)

5.20 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

4.54 (Koch 1983)

6.07 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)

4.88 (calculated, Bahnick & Doucette 1988)

4.761, 4.748 (marine humic substances of 5 mg/L DOC, selected, calculated-MCI χ , reported as $\log K_h$, Sabljic et al. 1989)

4.76, 4.87, 4.85, 3.75 (marine humic substance in concentrations. of 5,10, 20, 40 mg/L DOC, reported as $\log K_h$, Lara & Ernst 1989)

6.18 (calculated after Karickhoff et al. 1979, Capel & Eisenreich 1990)

5.08 (calculated after Schwarzenbach & Westall 1981, Capel & Eisenreich 1990)

5.73 (soil, shake flask-GC, Paya-Perez et al. 1991; quoted and selected, Baker et al. 2000)

5.90 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

4.62 (soil, calculated-MCI, Sabljic et al. 1995)

5.02 (soil, calculated-Characteristic Root Index [CRI], Saçan & Balcioglu 1996)

6.00 (soil, calculated- K_{OW} , Girvin & Scott 1997)

5.80; 4.50 (soil, calculated-universal solvation model; quoted exptl., Winget et al. 2000)

Sorption Partition Coefficient, $\log K_{OM}$:

4.50, 4.85 (selected, calculated-MCI χ , Sabljic 1984)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2 - 0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.0045 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)

$k_1 = 0.049 \text{ h}^{-1}$; $k_2 = 0.013 \text{ h}^{-1}$ (mayfly-sediment model II, Gobas et al. 1989)

$k_1 = 3360 \text{ d}^{-1}$; $k_2 = 0.0140 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 154 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 195 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 17–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment:

Soil: Sorption-Desorption Rate Constants: release rate constants k_d for labile PCBs sorbed to utility substation soils are: $k = 0.027 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.57 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, and $k = 0.27 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from first day gas-purge experiments; release rate constants k_d for nonlabile PCBs sorbed to utility substation soils are: $k = 0.00152 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.00223 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, and $k = 0.0039 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from 120–195 d experiments (Girvin et al. 1997).

Biota: $t_{1/2} = 155 \text{ d}$ in rainbow trout and $t_{1/2} = 62 \text{ d}$ its muscle (Niimi & Oliver 1983).

depuration $t_{1/2} = 154 \text{ d}$ for high-dose treatment, $t_{1/2} = 195 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.88 2,2',3,4,6-Pentachlorobiphenyl (PCB-88)

Common Name: 2,2',3,4,6-Pentachlorobiphenyl

Synonym: PCB-88

Chemical Name: 2,2',3,4,6-pentachlorobiphenyl

CAS Registry No: 55215-17-3

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

100 (Mackay et al. 1980; Burkhard et al. 1985a; Opperhuizen et al. 1988; Kühne et al. 1995; Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.2803

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 18 \pm 6\ kJ/mol$, $\Delta S_H = 0.03 \pm 0.01\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.36 (calculated-TSA, Burkhard 1984)

6.13 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.0371 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.64 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.16 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference: $k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987) $k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.95 2,2',3,5',6-Pentachlorobiphenyl (PCB-95)

Common Name: 2,2',3,5',6-Pentachlorobiphenyl

Synonym: PCB-95, 2,2',3,5',6-pentachloro-1,1'-biphenyl

Chemical Name: 2,2',3,5',6-pentachlorobiphenyl

CAS Registry No: 38379-99-6

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

98.5–100 (Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 0.184 (mp at $100^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.0336 (supercooled liquid S_L , calculated-TSA, Burkhard 1985b)

0.0541 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.0291, 0.0216, 0.0192, 0.0156; 0.021 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.0259 (calculated-TSA, Abramowitz & Yalkowsky 1990)

0.011 (calculated-MCI χ , Patil 1991)

0.00190 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

- 9.04 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:Sorption Partition Coefficient, $\log K_{OC}$:

- 6.16 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
- 5.3–6.8, 6.1; 7.40 (suspended sediment, average; algae > 50 μm , Oliver 1987a)
- 6.30 (Lake Michigan water column, Swackhamer & Armstrong 1987)
- 4.60, 4.66, 4.61, 3.70 (marine humic substances, in concentrations of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
- 4.603, 4.589 (marine humic substances, observed; calculated-MCI χ , reported as association coefficient $\log K_h$ at 5 mg/L DOC, Sabljic et al. 1989)
- 5.68, 5.70, 5.64 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)
- 5.55 (soil, shake flask-GC, Paya-Perez et al. 1991; quoted, Baker et al. 2000)
- 6.20 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 5.50 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)
 $k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_1 = 0.00030 \text{ h}^{-1}$; $k_2 = 0.184 \text{ h}^{-1}$ (blood plasma of ring doves, Drouillard & Norstrom 2000)
- $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 164 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
- $k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 225 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water: photodegradation $t_{1/2} = 8.29$ min when irradiated in a TiO_2 semiconductor aqueous suspension with a 1.5-kW high pressure Xenon lamp (De Felip et al. 1996)

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 164$ d for high-dose treatment, $t_{1/2} = 225$ d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.96 2,2',3,6,6'-Pentachlorobiphenyl (PCB-96)

Common Name: 2,2',3,6,6'-Pentachlorobiphenyl

Synonym: PCB-96

Chemical Name: 2,2',3,6,6'-pentachlorobiphenyl

CAS Registry No: 73575-54-9

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

53 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0368 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.130 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0157 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00735, 0.00166, 0.00419 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

139.8 (calculated-P/C, Burkhard 1984)

38.60 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

41.56 (calculated-QSPR, Dunnivant et al. 1992)

62.0 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 15 \pm 3\ kJ/mol$, $\Delta S_H = 0.02 \pm 0.01\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.33 (calculated-TSA, Burkhard 1984)

5.71 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

Sediment:

Soil:

Biota: depuration $t_{1/2} = 163$ d for high-dose treatment, $t_{1/2} = 188$ d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.98 2,2',3,4',6'-Pentachlorobiphenyl (PCB-98)

Common Name: 2,2',3,4',6'-Pentachlorobiphenyl

Synonym: PCB-98

Chemical Name: 2,2',3,4',6'-pentachlorobiphenyl

CAS Registry No: 60233-25-2

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

93 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

268.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0333 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0153, 0.0116, 0.0124 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.0164 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

7.05×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00735, 0.00753, 0.000804 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

0.00615, 0.00751 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.00692 (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4399/(T/K) + 12.54$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

68.90 (calculated-P/C, Burkhard 1984)

50.26 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

39.69 (calculated-QSPR, Dunnivant et al. 1992)

51.2 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 18 \pm 6 kJ/mol$, $\Delta S_H = 0.03 \pm 0.01 kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.36 (calculated-TSA, Burkhard 1984)

5.98, 6.16, 5.99 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

6.13 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.071 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.00 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

- 6.16 (suspended particulate matter, Burkhard 1984)
 4.589 (marine humic substances with 5 mg/L DOC, reported as association coefficient log K_h , calculated-MCI $^1\chi$, Sabljic et al. 1989)

Environmental Fate Rate Constants, k, and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 153 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 164 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 153 \text{ d}$ for high-dose treatment, $t_{1/2} = 164 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.99 2,2',4,4',5-Pentachlorobiphenyl (PCB-99)

Common Name: 2,2',4,4',5-Pentachlorobiphenyl

Synonym: PCB-99, 2,2',4,4',5-pentachloro-1,1'-biphenyl

Chemical Name: 2,2',4,4',5-pentachlorobiphenyl

CAS Registry No: 38380-01-7

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

81.0 (calculated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.0353 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985b)

0.0222 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.00366 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.0103 (calculated-TSA, Abramowitz & Yalkowsky 1990)

0.011 (calculated-MCI χ , Patil 1991)

0.00597 (estimated-EPIWIN v3.04, Hardy 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0029 (supercooled liquid P_L , GC-RT correlation, Bidleman 1984)

0.00735, 0.00342, 0.000532 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985a)

0.00316 (supercooled liquid, GC-RI correlation, Burkhard et al. 1985b)

0.00328, 0.00375 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.00147 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

$\log(P/mmHg) = 11.0 - 4740/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.0024, 0.00347 (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4533/(T/K) + 12.68$ (supercooled liquid, GC-RT correlation, Falconer & Bidleman 1994)

0.00229 (P_L , calculated-MCI $^3\chi$ and Characteristic Root Index CRI, Saçan & Balcioglu 1998)

0.000293 (estimated-EPIWIN v3.04, Hardy 2002)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

29.28 (calculated-P/C, Burkhard et al. 1985b)

21.68 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

30.50 (calculated-QSAR MCI χ , Sabljic & Güsten 1989)

7.90 (wetted-wall column-GC/ECD, Brunner et al. 1990)

57.0 (calculated-QSPR, Dunnivant et al. 1992)

9.39 (estimated-bond method EPIWIN v3.04, Hardy 2002)

35.4 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

51.8 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 16 \pm 6$ kJ/mol, $\Delta S_H = 0.02 \pm 0.02$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 6.29, 7.21 (HPLC-RT correlation, Rapaport & Eisenreich 1984)
- 6.41 (RP-HPLC-RI correlation, Brodsky & Ballschmiter 1988)
- 6.39 (calculated-TSA, Hawker & Connell 1988a)
- 6.26 (calculated-MCI χ , Patil 1991)
- 6.41 (recommended; Sangster 1993)
- 7.21 (recommended, Hansch et al. 1995)
- 6.60, 6.26–7.21 (calculated-Characteristic Root Index CRI; min.-max. range, Saçan & Inel 1995)
- 6.4014 (calculated-molecular properties MNDO-AM1 method, Makino 1998)
- 6.9795 (estimated-EPIWIN v3.04, Hardy 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 9.38 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 4.09 (fish, microcosm, Garten & Trabalka 1983)
- 5.14 (estimated-EPIWIN v3.04, Hardy 2002)

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

- 5.70, 5.10 (Lake Superior suspended solids, concn ratio-GC/ECD, Baker et al. 1986)
- 5.40 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.14 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
- 4.73 (marine humic substance, calculated-MCI χ , reported as $\log K_h$ at 5 mg /L DOC, Sabljic et al. 1989)
- 7.00 (calculated after Karickhoff et al. 1979, Capel & Eisenreich 1990)
- 5.68 (calculated after Schwarzenbach & Westall 1981, Capel & Eisenreich 1990)
- 6.10 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 5.54 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)
- 6.10 (soil, calculated- K_{OW} , Girvin & Scott 1997)
- 4.87 (estimated-EPIWIN v3.04, Hardy 2002)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: $t_{1/2} = 0.6419$ d from river, $t_{1/2} = 13.31$ d from lake (estimated-EPIWIN v3.04, Hardy 2002).

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120$ d, due to gas-phase loss process at room temp. (Atkinson 1987)
 $k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48$ d at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_1 = 8$ (food lipid mg)/(g worm lipid-d); $k_2 = 0.07 \text{ d}^{-1}$ (earthworm, Wågman et al. 2001)
- $k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 2252$ d (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
- $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 172$ d (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water: volatilization $t_{1/2} = 0.6419$ d from river, $t_{1/2} = 13.31$ d from lake (estimated-EPIWIN v.3.04, Hardy 2002).

Groundwater:

Sediment:

Soil:

Biota: elimination $t_{1/2} = 9$ d in earthworm given contaminated food (Wågman et al. 2001)

depuration $t_{1/2} = 252$ d for high-dose treatment, $t_{1/2} = 172$ d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.100 2,2',4,4',6-Pentachlorobiphenyl (PCB-100)

Common Name: 2,2',4,4',6-Pentachlorobiphenyl

Synonym: PCB-100, 2,2',4,4',6-pentachloro-1,1'-biphenyl

Chemical Name: 2,2',4,4',6-pentachlorobiphenyl

CAS Registry No: 39485-83-1

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

95 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0275 (supercooled liq. S_L , calculated-TSA, Burkhard et al. 1985b)

0.031 (unpublished data of Weil 1978; quoted, Kilzer et al. 1979; Geyer et al. 1980)

0.00666, 0.00580, 0.00941 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.011 (calculated-MCI χ , Patil 1991)

0.0130 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$):

0.00735, 0.00872, 0.00184 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985a)

0.00818 (supercooled liquid, GC-RT correlation, Burkhard et al. 1985b; quoted, Eisenreich 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

97.27 (calculated-P/C, Burkhard et al. 1985b; quoted, Eisenreich 1987)

62.62 (calculated-MCI χ , Sabljic & Güsten 1989)

56.98 (calculated-QSPR, Dunnivant et al. 1992)

51.2 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 18 \pm 6$ kJ/mol, $\Delta S_H = 0.03 \pm 0.01$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.23, 6.37, 6.08 (RP-HPLC-RI correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

6.23 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.66 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

1.11, 1.06 (adipose tissue of male, female Albino rats, Geyer et al. 1980)

0.32 (rodent, Garten & Trabalka 1983)

4.06, 3.91 (algae, calculated, Geyer et al. 1984)

4.06, 3.37, 4.44 (algae, fish, activated sludge, Freitag et al. 1984, 1985; quoted, Halfon & Reggiani 1986)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.24 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 4.567 (marine humic substance, calculated-MCI χ , reported as association coefficient $\log K_h$ at 5 mg/L DOC, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.010 \text{ d}^{-1}$ (10°C, sandworm, Goerke & Ernst 1977; quoted, Waid 1986)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

7.64 (HPLC-RT correlation, Woodburn et al. 1984)

6.50 (generator column-HPLC, Woodburn et al. 1984)

6.88, 7.0 (HPLC- k' correlation, calculated, De Kock & Lord 1987)

6.50 (generator column-GC/ECD, Doucette & Andren 1987, 1988)

6.36, 6.39, 6.18, 6.27 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

5.88 (HPLC-RT correlation, Doucette & Andren 1988)

6.23, 6.18 (RP-HPLC- k' correlation, different stationary phases, Sherblom & Eganhouse 1988)

6.41 (HPLC- k' correlation, Noegrohati & Hammers 1992)

6.16 (recommended, Sangster 1993)

6.50 (recommended, Hansch et al. 1995)

6.15, 6.33 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and the reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section.

8.30 (calculated- K_{OW}/K_{AW} , Wania & Mackay 1996)

9.31* (20°C, generator column-GC, measured range -10 to 30°C, Harner & Bidleman 1996)

$\log K_{OA} = -3.82 + 3841/(T/K)$; temp range -10 to 30°C (generator Column-GC, Harner & Bidleman 1996)

8.80; 8.20 (fugacity meter/generator column-GC; calculated, Kömp & McLachlan 1997a)

$\log K_{OA} = -5.84 + 4360/(T/K)$ (fugacity meter, temp range 10–43°C, Kömp & McLachlan 1997a)

9.79 (10°C, estimated, Thomas et al. 1998)

10.49, 9.44; 9.29 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)

9.37 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

9.14; 9.05 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

8.90, 8.73 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)

$\log K_{OA} = 4291/(T/K) - 5.50$ (LDV linear regression of literature data, Li et al. 2003)

$\log K_{OA} = 3785/(T/K) - 5.35$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, $\log \text{BCF}$:

3.18 (green sunfish, 15 d in static water, Sanborn et al. 1975)

3.74, 4.78, 4.08, 4.24 (algae, snail, fish, mosquito, Metcalf et al. 1975)

4.66 (fish, flowing water, Kenaga & Goring; Kenaga 1980)

3.92, 3.60 (calculated-S, calculated- K_{OC} , Kenaga 1980)

4.09 (fish, microcosm, Garten & Trabalka 1983)

3.30–4.15 highest value, not equilibrated (rainbow trout, 15°C, steady-state BCF of 7- to 96-d laboratory study, Oliver & Niimi 1985)

> 5.40, 4.15; 6.92 (rainbow trout, laboratory data: kinetic BCF; steady state BCF; Lake Ontario field BCF, Oliver & Niimi 1985)

2.73, 2.60 (human fat of lipid, wet wt. basis, calculated- K_{OW} , Geyer et al. 1987)

4.15 (fish, quoted, Isnard & Lambert 1988)

- 6.55 (rainbow trout, lipid basis, Noegrohati & Hammers 1992)
- 5.47; 7.00 (22°C, zebrafish: log BCF_w wet wt basis; log BCF_L lipid wt basis, Fox et al. 1994)
- 3.32–5.15 (various marine species, mean dry wt. BCF, Hope et al. 1998)
- 4.84–6.26 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)
- 4.06, 6.06 (*Daphnia*, 21-d renewal: wet wt basis, lipid wt basis, Geyer et al. 2000)
- 5.47, 7.0 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)
- 5.10, 7.02 (mussel *Mytilus edulis*: wet wt basis, lipid wt basis, Geyer et al. 2000)
- 4.03; 3.98 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)

Partition Coefficient between particulate and dissolved contaminant concentrations, log K_p or log K_d

- 5.60, 5.10 (Lake Superior suspended solids, concn ratio-GC/ECD, Baker et al. 1986)
- 5.30 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Sorption Partition Coefficient, log K_{OC}:

- 4.63 (Kenaga & Goring 1980)
- 4.74, 4.80 (estimated-S, K_{OW}, Lyman 1982)
- 5.13, 4.67 (estimated-BCF, Lyman 1982)
- 4.70; 5.45 (soil, slurry method; HPLC-RT correlation, Swann et al. 1983)
- 6.14 (suspended particulate matter, calculated-K_{OW}, Burkhard 1984)
- 5.60; 5.50; 6.60 (field data of sediment trap material; Niagara River-organic matter; calculated-K_{OW}, Oliver & Charlton 1984)
- 5.65 (suspended solids-Lake Superior, field measurement-GC/ECD, Baker et al. 1986)
- 6.68, 5.58 (suspended solids-Lake Superior: calculated-K_{OW}, Baker et al. 1986)
- 4.87, 4.07 (Sanhedron soil, Suwannee River, humic acid, shake flask-GC/ECD, Chiou et al. 1986,1987)
- 4.12, 4.10 (Sanhedron soil, Suwannee River, fulvic acid, shake flask-GC/ECD, Chiou et al. 1986,1987)
- 5.1–6.7, 6.2 (suspended sediment, average, Oliver 1987a)
- 5.41, 5.41, 4.81, 4.09, 4.01 (Aldrich humic acid Na salt, Fluka-Tridon humic acid, Calcasieu River humic extract, Suwannee River water sample, Sopchoppy River water sample, Chiou et al. 1987)
- 6.25 (Lake Michigan water column, Swackhamer & Armstrong 1987)
- 4.77, 4.86, 4.80, 3.86 (humic substances, in concentrations. of 5, 10, 20, 40 mg C/L, reported as log K_h, Lara & Ernst 1989)
- 4.772, 4.726 (marine humic substances of 5 mg/L DOC, reported as association coefficient log K_h, quoted exptl; calculated-MCI χ , Sabljic et al. 1989)
- 5.86 (calculated after Karickhoff et al. 1979, Capel & Eisenreich 1990)
- 5.58 (calculated after Schwarzenbach & Westall 1981, Capel & Eisenreich 1990)
- 5.81, 5.83, 5.78 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)
- 5.67 (soil, shake flask-GC, Paya-Perez et al. 1991)
- 5.90 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 4.63 (soil, Sabljic et al. 1995)
- 5.80; 5.58 (soil, quoted lit.; calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)
- 5.90; 4.60 (soil, calculated-universal solvation model; quoted lit., Winget et al. 2000)
- 5.73 (sediment: organic carbon OC \geq 0.5%, average, Delle Site 2001)
- 4.78–7.03; 4.60–6.70 (range, calculated from sequential desorption of 11 urban soils; lit. range, Krauss & Wilcke 2001)
- 5.59; 6.19, 5.53, 6.04 (20°C, batch equilibrium, A2 alluvial grassland soil; calculated values of expt 1,2,3-solvophobic approach, Krauss & Wilcke 2001)

Sorption Partition Coefficient, log K_{OM}:

- 4.63, 4.84 (quoted, calculated-molecular connectivity indices χ , Sabljic 1984)

Sorption Partition Coefficient, log K_p:

- 4.87–5.35 (field-generated particulates, New Bedford Harbor, Bergen et al. 1993)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photodegradation rate constants $k = (0.20 \pm 0.01) \text{ h}^{-1}$, $(0.20 \pm 0.04) \text{ h}^{-1}$, with $t_{1/2} = 3.4 \text{ h}$, 3.7 h in aqueous solution with the presence of diethylamine after exposure to simulated sunlight (Lin et al. 1995).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{\text{OH}}(\text{aq.}) = 4.6 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C , half-lives range from $\sim 4\text{--}11 \text{ d}$ in freshwater systems, $0.1\text{--}10 \text{ d}$ in cloud water, $> 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{\text{OH}}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: degradation rate, $k = 1.5 \times 10^{-8} \text{ nmol cell}^{-1} \text{ h}^{-1}$ by species of *Alcaligenes* and *Acinetobacter* (Furukawa et al. 1978, selected, NAS 1979);

85% degradation at 24 h in one of the PCB mixture including congeners ranging from di- to hexa-PCBs with several structure classes, by microorganism *Alcaligenes eutrophus* H850 (Bedard et al. 1986);

aerobic biodegradation $t_{1/2} = 1.32 \text{ d}$ with the addition of polymer chitin, $t_{1/2} = 0.80 \text{ d}$ with chitin plus adapted microbes in flow microcosm with water and sedimentary materials from the field (Abramowicz 1990).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 > 0.0007 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)

$k_1 = 180 \text{ d}^{-1}$; $k_2 = 0.0007 \text{ d}^{-1}$ (rainbow trout, Oliver & Niimi 1985)

$k_1 = 0.049 \text{ h}^{-1}$; $k_2 = 0.014 \text{ h}^{-1}$ (mayfly-sediment model II, Gobas et al. 1989)

$\log 1/k_2 > 3.1$, 3.6 h (fish, quoted, calculated- K_{OW} , Hawker & Connell 1988b).

$k_1 = 3850 \text{ d}^{-1}$; $k_2 = 0.0130 \text{ d}^{-1}$ (22°C , zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.054 \text{ d}^{-1}$ with an elimination $t_{1/2} = 12.9 \text{ d}$ (earthworm, Belfroid et al. 1995)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 131 \text{ d}$ and $k_2 = 0.012 \text{ d}^{-1}$ with $t_{1/2} = 56 \text{ d}$ for food concn of 20 ng/g and 148 ng/g , respectively in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

$k_1 = 0.00082 \text{ h}^{-1}$; $k_2 = 0.160 \text{ h}^{-1}$ (blood plasma of ring doves, Drouillard & Norstrom 2000)

$k_1(\text{calc}) = 6$ (food lipid $\text{mg}/(\text{g worm lipid-d})$; $k_2(\text{calc}) = 0.06 \text{ d}^{-1}$ (earthworm, Wågman et al. 2001)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 172 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 246 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of $60\text{--}120 \text{ d}$ due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of $16\text{--}48 \text{ d}$ based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995);

suggested $t_{1/2} = 3000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: aerobic biodegradation $t_{1/2} = 1.32 \text{ d}$ with the addition of polymer chitin, $t_{1/2} = 0.80 \text{ d}$ with chitin plus adapted microbes in flow microcosm with water and sedimentary materials from the field (Portier & Fujisaki 1988; quoted, Abramowicz 1990);

half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH-oxidation (Sedlak & Andren 1991);

photodegradation $t_{1/2} = (3.4 \pm 0.15) \text{ h}$, $(3.7 \pm 0.8) \text{ h}$ in aqueous solution with the presence of diethylamine after exposure to simulated sunlight (Lin et al. 1995);

$t_{1/2} = 60000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: $t_{1/2} = 87600 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: Sorption-Desorption Rate Constants: release rate constants k_d for labile PCBs sorbed to utility substation soils are: $k = 0.039 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.65 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 0.54 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.24 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from first day gas-purge experiments; release rate constants k_d for nonlabile PCBs sorbed to utility substation soils are $k = 0.00064 \text{ d}^{-1}$ from Conkelley surface soil consist of sand and silt with 0.05% OC-organic carbon, $k = 0.00188 \text{ d}^{-1}$ from Conkelley subsurface soil, 0.4-m deep, consist of sand and silt with 0.13% OC, $k = 0.00073 \text{ d}^{-1}$ from Tarehee surface soil consist of sand and silt with 0.02% OC and $k = 0.00247 \text{ d}^{-1}$ from Conkelley surface soil consist of silt with 0.01% OC, rates derived from 120–195 d experiments (Girvin et al. 1997)

$t_{1/2} = 87600 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: $t_{1/2} = 1000 \text{ d}$ in rainbow trout (Niimi & Oliver 1983; Oliver & Niimi 1985), and $t_{1/2} = 85 \text{ d}$ in its muscle, (Niimi & Oliver 1983);

elimination $t_{1/2} = 12.9$ from earthworm (Belfroid et al. 1995)

depuration $t_{1/2} = 56\text{--}131 \text{ d}$ in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

$t_{1/2} = 4.3 \text{ h}$ in blood plasma (ring doves, Drouillard & Norstrom 2000);

elimination $t_{1/2} = 12 \text{ d}$ in earthworm given contaminated food (predicted, Wågman et al. 2001).

depuration $t_{1/2} = 172 \text{ d}$ for high-dose treatment, $t_{1/2} = 24446 \text{ d}$ for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

TABLE 7.1.1.101.1

Reported aqueous solubilities, vapor pressures, Henry's law constants and octanol-air partition coefficients of 2,2',4,5,5'-pentachlorobiphenyl (PCB-101) at various temperatures and the reported empirical temperature dependence equations

Aqueous solubility		Vapor pressure		Henry's law constant		log K_{OA}	
Dickhut et al. 1986		Westcott et al. 1981		Bamford et al. 2000		Harner & Bidleman 1996	
generator column-GC/ECD		gas saturation-GC		gas stripping-GC/MS		generator column-GC	
$t/^\circ\text{C}$	$S/\text{g}\cdot\text{m}^{-3}$	$t/^\circ\text{C}$	P/Pa	$t/^\circ\text{C}$	$H/(\text{Pa}\cdot\text{m}^3/\text{mol})$	$t/^\circ\text{C}$	log K_{OA}
4	0.0061	25	0.00096	4	15.75	-10	10.70

				$\Delta S/(\text{J}\cdot\text{mol}^{-1}\cdot\text{K}^{-1}) = 66 \pm 10$			

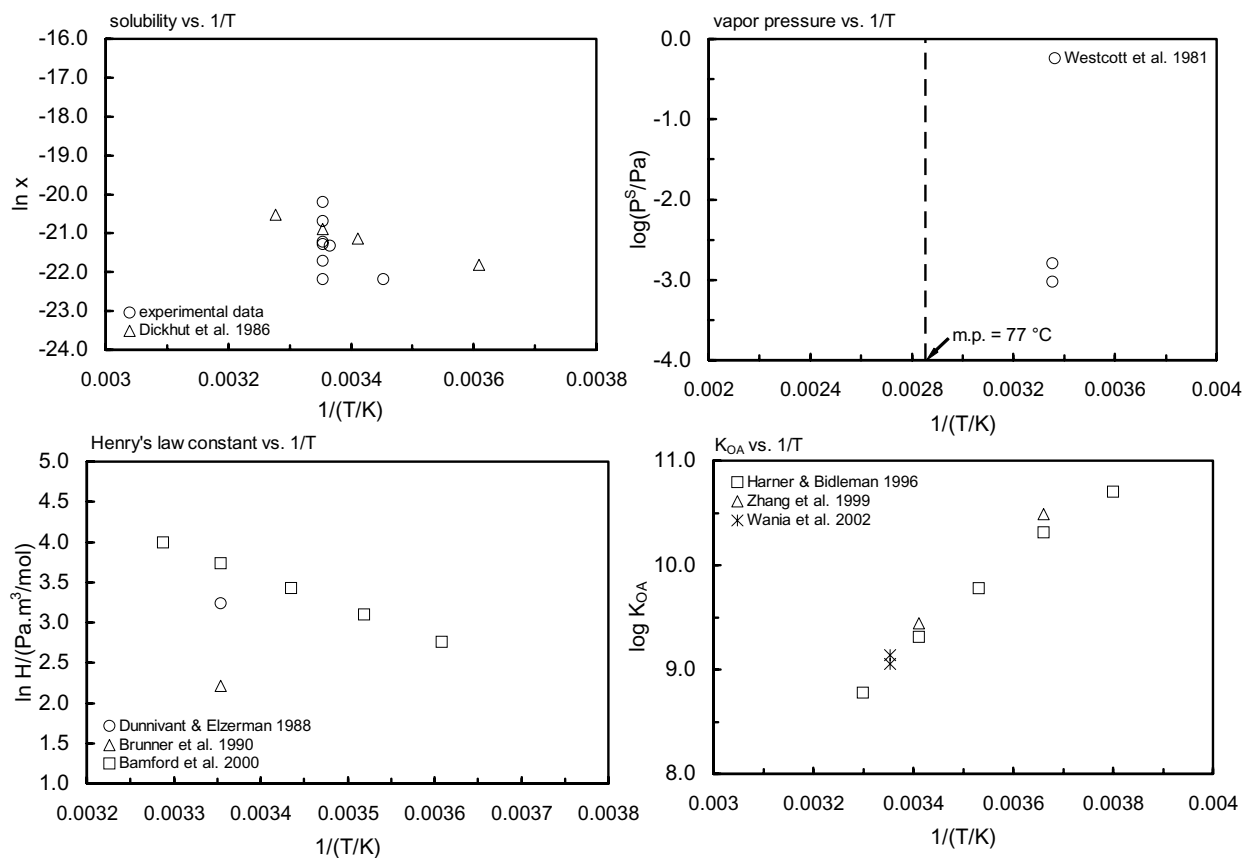

FIGURE 7.1.1.101.1 Logarithm of mole fraction solubility, vapor pressure, Henry's law constant and K_{OA} versus reciprocal temperature for 2,2',4,5,5'-pentachlorobiphenyl (PCB-101).

7.1.1.102 2,2',4,5,6'-Pentachlorobiphenyl (PCB-102)

Common Name: 2,2',4,5,6'-Pentachlorobiphenyl

Synonym: PCB-102, 2,2',4,5,6'-pentachloro-1,1'-biphenyl

Chemical Name: 2,2',4,5,6'-pentachlorobiphenyl

CAS Registry No: 68194-06-9

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

93 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0314 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0065 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

6.61×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00735, 0.00706, 0.00184 (calculated-MW, GC-RI correlation, calculated- χ , Burkhard et al. 1985b)

0.00527, 0.00667 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P/mmHg) = 10.80 - 4630/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

$\log(P_L/Pa) = -4399/(T/K) + 12.48$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

68.60 (calculated-P/C, Burkhard 1984)

35.26 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

9.12 (wetted-wall column-GC/ECD, Brunner et al. 1990)

37.6 (calculated-QSPR, Dunnivant et al. 1992)

51.2 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 18 \pm 6\ kJ/mol$, $\Delta S_H = 0.03 \pm 0.01\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.39 (calculated-TSA, Burkhard 1984)

6.16 (calculated-TSA, Hawker & Connell 1988; quoted, Hansch et al. 1995)

6.0959 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.13 (calculated-QSPR/quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.19 (suspended particulate matter, Burkhard 1984)
4.589 (marine humic substances with 5 mg/L DOC, reported as association coefficient $\log K_h$, calculated-MCI $^1\chi$, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.103 2,2',4,5',6-Pentachlorobiphenyl (PCB-103)

Common Name: 2,2',4,5',6-Pentachlorobiphenyl

Synonym: PCB-103, 2,2',4,5',6-pentachloro-1,1'-biphenyl

Chemical Name: 2,2',4,5',6-pentachlorobiphenyl

CAS Registry No: 60145-21-3

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

81 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0275 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00986, 0.00859, 0.0164, 0.0113 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.0164 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

9.23×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00735, 0.00983, 0.00804 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

0.00887, 0.0112 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.00617 (supercooled liquid P_L : GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4399/(T/K) + 12.70$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

109.43 (calculated-P/C, Burkhard 1984)

56.24 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

51.02 (calculated-QSPR, Dunnivant et al. 1992)

51.2 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 18 \pm 6$ kJ/mol, $\Delta S_H = 0.03 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.44 (calculated-TSA, Burkhard 1984)

6.11, 6.25, 5.92, 6.14 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

6.22 (calculated-TSA, Hawker & Connell 1988; quoted, Hansch et al. 1995)

6.11 (recommended, Sangster 1993)

8.7057 (calculated-UNIFAC group contribution, Chen et al. 1993)

6.1499 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.00 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.24 (suspended particulate matter, Burkhard 1984)

4.567 (marine humic substances with 5 mg/L DOC, reported as association coefficient $\log K_h$, calculated-MCI $^1\chi$, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

6.08 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

10.06 (calculated-QSPR, Dunnivant et al. 1992)

2.43 (calculated-QSPR, Achman et al. 1993)

33.6* \pm 1.3 (gas stripping-GC, measured range 4–31°C, Bamford et al. 2000)

$\ln K_{AW} = 26.221 - 9093.1/(T/K)$; temp range 4–31°C (gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(75.6/\text{kJ}\cdot\text{mol}^{-1})/RT] + (0.218/\text{kJ}\cdot\text{mol}^{-1}\cdot\text{K}^{-1})/R$; where $R = 8.314 \text{ J}\cdot\text{K}^{-1}\cdot\text{mol}^{-1}$ and temp range: 4–31°C, (gas stripping-GC, Bamford et al. 2000)

33.9 (exptl. data, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 76 \pm 8 \text{ kJ/mol}$, $\Delta S_H = 0.22 \pm 0.03 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

33.88, 13.80 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

$\log H/(\text{Pa m}^3/\text{mol}) = -3269/(T/K) + 12.1$ (FAV final adjusted eq., Li et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.41, 6.68, 7.14, 6.93 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

5.82 (generator column-GC; Hawker & Connell 1988a)

6.79 (recommended, Sangster 1993)

6.65 (recommended, Hansch et al. 1995)

4.97–5.10 (shake flask/slow stirring-GC/ECD, both phases, Fisk et al. 1999)

6.61 (generator column-GC/ECD, Yeh & Hong 2002)

6.61, 6.82 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

10.27* (20°C, generator column-GC, measured range –10 to 30°C, Harner & Bidleman 1996)

$\log K_{OA} = -5.68 + 4678/(T/K)$; (temp range –10 to 30°C, Harner & Bidleman 1996)

11.41, 10.20; 10.02 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)

10.17 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

7.40, 7.34 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)

$\log K_{OA} = 4630/(T/K) - 6.0$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

2.82–4.26 (various marine species, mean dry weight, Hope et al. 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

6.09 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)

4.906 (as $\log K_h$, association coefficient with marine humic substance, calculated-MCI χ , Sabljic et al. 1989)

5.81 (soil, shake flask-GC, Paya-Perez et al. 1991)

6.40 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

5.50 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.014 \text{ d}^{-1}$ with $t_{1/2} = 48 \text{ d}$ and $k_2 = 0.014 \text{ d}^{-1}$ with $t_{1/2} = 50 \text{ d}$ for food concn of 17 ng/g and 133 ng/g, respectively in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 181 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 204 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment: $t_{1/2} = 7 \text{ yr}$ (Geyer et al. 2000)

Soil:

Biota: reported biological $t_{1/2} = 155$ to $> 1000 \text{ d}$ for trout, $t_{1/2} = 62$ –101 d for trout muscle; $t_{1/2} = 73$ to $> 200 \text{ d}$ for carp for pentachlorobiphenyls (Niimi 1987)

Depuration $t_{1/2} = 49$ –50 d in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

depuration $t_{1/2} = 181 \text{ d}$ for high-dose treatment, $t_{1/2} = 204 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

TABLE 7.1.1.105.1

Reported aqueous solubilities, Henry's law constants and octanol-air partition coefficients of 2,3,3',4,4'-pentachlorobiphenyl (PCB 105) at various temperatures and reported empirical temperature dependence equations

Aqueous solubility		Henry's law constant		log K_{OA}	
Huang & Hong 2002		Bamford et al. 2000		Harner & Bidleman 1996

		$\Delta S/(\text{J}\cdot\text{mol}^{-1}\cdot\text{K}^{-1}) = 218 \pm 28$			

FIGURE 7.1.1.105.1 Logarithm of mole fraction solubility, Henry's law constant and K_{OA} versus reciprocal temperature for 2,3,3',4,4'-pentachlorobiphenyl (PCB-105).

7.1.1.106 2,3,3',4,5-Pentachlorobiphenyl (PCB-106)

Common Name: 2,3,3',4,5-Pentachlorobiphenyl

Synonym: PCB-106, 2,3,3',4,5-pentachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4,5-pentachlorobiphenyl

CAS Registry No: 70424-69-0

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

105 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0411 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0082, 0.0088, 0.00517, 0.0058 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.00326 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.0050 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00735, 0.0180, 0.00419 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

0.00138, 0.00127 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -4688/(T/K) + 12.86$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

39.82 (calculated-P/C, Burkhard 1984)

19.66 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

16.7 (calculated-QSPR, Dunnivant et al. 1992)

36.7 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 56 \pm 17$ kJ/mol, $\Delta S_H = 0.15 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.29 (calculated-TSA, Burkhard 1984)

6.79, 6.79, 7.22, 6.89 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

6.64 (calculated-TSA, Hawker & Connell 1988; quoted, Hansch et al. 1995)

6.92 (recommended, Sangster 1993)

6.6213 (calculated-molecular properties MNDO-AMI method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.57 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

- 6.09 (suspended particulate matter, Burkhard 1984)
4.906 (marine humic substances with 5 mg/L DOC, reported as association coefficient log K_h , calculated-MCI $^1\chi$, Sabljic et al. 1989)

Environmental Fate Rate Constants, k, and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.109 2,3,3',4,6-Pentachlorobiphenyl (PCB-109)

Common Name: 2,3,3',4,6-Pentachlorobiphenyl

Synonym: PCB-109, 2,3,3',4,6-pentachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4,6-pentachlorobiphenyl

CAS Registry No: 74472-35-8

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

73 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0434 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0103 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0063 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00735, 0.00675, 0.000804 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

47.52 (calculated-P/C, Burkhard 1984)

28.56 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

39.42 (calculated-QSPR, Dunnivant et al. 1992)

44.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 29 \pm 8 kJ/mol$, $\Delta S_H = 0.06 \pm 0.01 kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.27 (calculated-TSA, Burkhard 1984)

6.48 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.5063 (quoted exptl., calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.59 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.07 (suspended particulate matter, Burkhard 1984)

4.748 (marine humic substances with 5 mg/L DOC, reported as association coefficient $\log K_h$, calculated-MCI χ , Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference: $k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987) $k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

0.00182, 0.00199 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

9.48×10^{-4} ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

$\log(P/mmHg) = 11.0 - 4780/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.00141, 0.00224 (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4522/(T/K) + 12.43$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

0.00258 (P_L , calculated-MCI $^3\chi$ and Characteristic Root Index CRI, Saçan & Balcioglu 1998)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ or as indicated):

37.48 (calculated-P/C, Murphy et al. 1983)

17.12 (calculated-P/C, Burkhard et al. 1985b)

10.74 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

19.15 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

19.89 (calculated-QSPR, Dunnivant et al. 1992)

5.966 (calculated-QSPR, Achman et al. 1993)

18.5 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

42.0 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 38 \pm 7$ kJ/mol, $\Delta S_H = 0.09 \pm 0.02$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 6.20 (RP-HPLC-RI correlation, Brodsky & Ballschmiter 1988)
- 6.48 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)
- 6.22 (generator column-GC, Larsen et al. 1992)
- 6.20 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$ or as indicated and reported temperature dependence equations:

- 9.06; 8.58 (fugacity meter/generator column-GC; calculated, Kömp & McLachlan 1997a)
- $\log K_{OA} = -6.16 + 4540/(T/K)$; (fugacity meter, temp range 10–43°C, Kömp & McLachlan 1997a)
- 10.14 (10°C, estimated, Thomas et al. 1998)
- 9.06 (quoted, Kömp & McLachlan 1997b, Kaupp & McLachlan 1999)
- 10.61, 9.58; 9.80 (0, 20°C, multi-column GC-k' correlation; calculated at 20°C, Zhang et al. 1999)
- 9.19 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 5.18, 6.48 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

- 5.60, 5.10 (Lake Superior suspended solids, concn ratio-GC/ECD, Baker et al. 1986)
- 5.50 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.06 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
- 5.6–6.8, 6.4; 7.70 (suspended sediment, average; algae > 50µm, Oliver 1987a)
- 4.72, 4.80, 4.77, 3.79 (marine humic substances, in concentrations. of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
- 4.72, 4.75 (marine humic substances of 5 mg/L DOC, quoted, calculated-MCI χ , Sabljic et al. 1989)
- 6.32 (calculated after Karickhoff et al. 1979, Capel & Eisenreich 1990)
- 5.20 (calculated after Schwarzenbach & Westall 1981, Capel & Eisenreich 1990)
- 5.71 (soil, shake flask-GC, Paya-Perez et al. 1991)
- 6.20 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 5.50 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)
- 5.80 (soil, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photodegradation rate constant $k = (0.07 \pm 0.01) \text{ h}^{-1}$ with $t_{1/2} = 9.9 \text{ h}$ in aqueous solution with the presence of diethylamine after exposure to simulated sunlight (Lin et al. 1995).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{aq.}) = 4.3 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, PCB in Aroclor 1242 mixture, oxidized by hydroxyl radicals generated with Fenton's reagent in aqueous solutions at 25°C, half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines (relative rate method, Sedlak & Andren 1991)

$k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 0.00064 \text{ h}^{-1}$; $k_2 = 0.094 \text{ h}^{-1}$ (blood plasma of ring doves, Drouillard & Norstrom 2000)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 171 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 204 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water: half-lives range from $t_{1/2} \sim 4\text{--}11 \text{ d}$ in freshwater systems, $t_{1/2} = 0.1\text{--}10 \text{ d}$ in cloud water, $t_{1/2} > 1000 \text{ d}$ in oceans for PCBs with as many as 8 chlorines for OH- oxidation (Sedlak & Andren 1991); photodegradation $t_{1/2} = (9.9 \pm 1.6) \text{ h}$ in aqueous solution with the presence of diethylamine after exposure to simulated sunlight (Lin et al. 1995).

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 171 \text{ d}$ for high-dose treatment, $t_{1/2} = 204 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.111 2,3,3',5,5'-Pentachlorobiphenyl (PCB-111)

Common Name: 2,3,3',5,5'-Pentachlorobiphenyl

Synonym: PCB-111, 2,3,3',5,5'-pentachloro-1,1'-biphenyl

Chemical Name: 2,3,3',5,5'-pentachlorobiphenyl

CAS Registry No: 39635-32-0

Molecular Formula: $C_{12}H_4Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

79 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0315 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00411 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$):

0.00156 (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00735, 0.00633, 0.00419 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

16.21 (calculated-P/C, Burkhard 1984)

49.45 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

19.89 (calculated-QSPR, Dunnivant et al. 1992)

36.7 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 56 \pm 17 kJ/mol$, $\Delta S_H = 0.15 \pm 0.01 kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.39 (calculated-TSA, Burkhard 1984)

6.76 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.7224 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.08 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.19 (suspended particulate matter, Burkhard 1984)

4.862 (marine humic substances with 5 mg/L DOC, reported as association coefficient $\log K_h$, calculated-MCI χ , Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference: $k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987) $k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Soil:

Biota: elimination $t_{1/2} = 11 \text{ d}$ in earthworm given contaminated food (Wågman et al. 2001)

7.1.1.113 2,3,3',5',6-Pentachlorobiphenyl (PCB-113)

Common Name: 2,3,3',5',6-Pentachlorobiphenyl

Synonym: PCB-113, 2,3,3',5',6-pentachloro-1,1'-biphenyl

Chemical Name: 2,3,3',5',6-pentachlorobiphenyl

CAS Registry No: 68194-10-5

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

65 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0382 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0036 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.0103 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

3.372×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00735, 0.00365, 0.00184 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

0.00306, 0.00368 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.00240 (supercooled liquid P_L : GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4522/(T/K) + 12.63$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

28.88 (calculated-P/C, Burkhard 1984)

48.43 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

33.02 (calculated-QSPR, Dunnivant et al. 1992)

44.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 29 \pm 8 kJ/mol$, $\Delta S_H = 0.06 \pm 0.01 kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.31 (calculated-TSA, Burkhard 1984)

6.45 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

6.54 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.45 (recommended, Sangster 1993)

6.3808 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.24 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

6.11 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water: measured rate constant $k < 0.05 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 2.7–6.3 and $23 \pm 2^\circ\text{C}$, with $t_{1/2} > 8 \text{ d}$ at pH 7 (Yao & Haag 1991).

Ground water:

Sediment:

Soil:

Biota:

7.1.1.114 2,3,4,4',5-Pentachlorobiphenyl (PCB-114)

Common Name: 2,3,4,4',5-Pentachlorobiphenyl

Synonym: PCB-114, 2,3,4,4',5-pentachloro-1,1'-biphenyl

Chemical Name: 2,3,4,4',5-pentachlorobiphenyl

CAS Registry No: 74472-37-0

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

99 (Burkhard et al. 1985b; Brodsky & Ballschmiter 1988)

109 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

224.5 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.188 (at mp $99^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0121, 0.00879(RP-HPLC- k' correlation, different mobile phases, Brodsky & Ballschmiter 1988)

0.00146; 0.00246(generator column-GC/ECD; estimated, Hong & Qiao 1995)

0.00263 (generator column-GC/ECD, measured range $5-35^{\circ}C$, Huang & Hong 2002)—see comment by Van Noort 2004.

0.000732, 0.00157, 0.00263, 0.00505 ($5, 15, 25, 35^{\circ}C$, generator column-GC/ECD, Huang & Hong 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

5.58×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00136, 0.000881, 0.000352 (calculated-MW, GC-RI correlation, calculated- χ , Burkhard et al. 1985b)

3.45×10^{-4} ($20^{\circ}C$, supercooled liquid P_L , Murphy et al. 1987)

0.00124, 0.000115(supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

6.92×10^{-4} (supercooled liquid P_L ; GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4688/(T/K) + 12.82$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

42.56 (calculated-P/C, Burkhard et al. 1985a)

6.99 ($20^{\circ}C$, calcd-P/C, Murphy et al. 1987)

11.55 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

14.48 (calculated-QSPR, Dunnivant et al. 1992)

4.96 (calculated-QSPR, Achman et al. 1993)

36.7 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 56 \pm 17$ kJ/mol, $\Delta S_H = 0.15 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.29 (calculated-TSA, Burkhard 1984)

- 6.45, 6.78 (RP-HPLC- k' correlation, different mobile phases, Brodsky & Ballschmiter 1988)
 6.65 (calculated, Hawker & Connell 1988a; quoted, Hansch et al. 1995)
 6.72 (recommended, Sangster 1993)
 6.5879 (calculated-molecular properties MNDO-AM1, Makino 1998)
 6.47 (generator column-GC/ECD, Yeh & Hong 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 9.62 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 5.34, 6.65 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.09 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 4.906 (as $\log K_h$, association coefficient with marine humic substance, calculated-MCI χ , Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 164 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 187 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: reported biological $t_{1/2} = 155$ to $> 1000 \text{ d}$ for trout, $t_{1/2} = 62\text{--}101 \text{ d}$ for trout muscle; $t_{1/2} = 73$ to $> 200 \text{ d}$ for carp for pentachlorobiphenyls (Niimi 1987)

depuration $t_{1/2} = 164 \text{ d}$ for high-dose treatment, $t_{1/2} = 187 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.115 2,3,4,4',6-Pentachlorobiphenyl (PCB-115)

Common Name: 2,3,4,4',6-Pentachlorobiphenyl

Synonym: PCB-115, 2,3,4,4',6-pentachloro-1,1'-biphenyl

Chemical Name: 2,3,4,4',6-pentachlorobiphenyl

CAS Registry No: 74472-38-1

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Sediment:

Soil:

Biota: $t_{1/2} > 1000 \text{ d}$ in rainbow trout, and $t_{1/2} = 100 \text{ d}$ in its muscle, 100 d (Niimi & Oliver 1983).

7.1.1.117 2,3,4',5,6-Pentachlorobiphenyl (PCB-117)

Common Name: 2,3,4',5,6-Pentachlorobiphenyl

Synonym: PCB-117, 2,3,4',5,6-pentachloro-1,1'-biphenyl

Chemical Name: 2,3,4',5,6-pentachlorobiphenyl

CAS Registry No: 68194-11-6

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

115 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0457 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0042, 0.00651, 0.0248, 0.00494 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.00411 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

5.23×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00735, 0.00561, 0.000804 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

$\log(P/mmHg) = 11.10 - 4800/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

0.00257 (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4522/(T/K) + 12.56$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

37.29 (calculated-P/C, Burkhard 1984)

25.13 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

33.02 (calculated-QSPR, Dunnivant et al. 1992)

44.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 29 \pm 8$ kJ/mol, $\Delta S_H = 0.06 \pm 0.01$ kJ/mol·K (Bamford et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.25 (calculated-TSA, Burkhard 1984)

6.37, 6.33, 6.49, 6.28 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

6.46 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.39 (recommended, Sangster 1993)

6.4587 (calculated-molecular properties MNDO-AMI method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.20 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

6.05 (suspended particulate matter, Burkhard 1984)

4.748 (marine humic substances with 5 mg/L DOC, reported as association coefficient log K_h , calculated-MCI $^1\chi$, Sabljic et al. 1989)

Environmental Fate Rate Constants, k, and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Biota:

7.1.1.118 2,3',4,4',5-Pentachlorobiphenyl (PCB-118)

Common Name: 2,3',4,4',5-Pentachlorobiphenyl

Synonym: PCB-118, 2,3',4,4',5-pentachloro-1,1'-biphenyl

Chemical Name: 2,3',4,4',5-pentachlorobiphenyl

CAS Registry No: 31508-00-6

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

106 (Burkhard et al. 1985; Brodsky & Ballschmiter 1988)

109 (Kühne et al. 1995; Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

224.5 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K, F: 0.158 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.01344 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.0153 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.00107; 0.00198 (generator column-GC/ECD; estimated, Hong & Qiao 1995)

0.00207* (generator column-GC/ECD, measured range $5-35^{\circ}C$, Huang & Hong 2002)—see comment by Van Noort 2004.

0.0290, 0.0223 (supercooled liquid S_L : derivation of literature-derived value, final-adjusted value, Li et al. 2003)
 $\log [S_L/(mol\ m^{-3})] = -1339/(T/K) + 0.32$ (supercooled liquid, FAV final adjusted eq., Li et al. 2003)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.00120 (P_L supercooled liquid, GC-RT correlation, Bidleman 1984)

9.62×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.000167 (GC-RI correlation, Burkhard et al. 1985b)

0.00123, 0.00104 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

3.54×10^{-4} ($20^{\circ}C$, supercooled liquid P_L , Murphy et al. 1987)

8.32×10^{-4} , 1.12×10^{-3} (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log (P_L/Pa) = -4664/(T/K) + 12.72$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

8.91×10^{-4} , 1.0×10^{-4} (supercooled liquid P_L : LDV literature derived value, FAV final adjusted value, Li et al. 2003)

$\log P_L/Pa = -4853/(T/K) + 13.23$ (supercooled liquid, LDV linear regression of literature data, Li et al. 2003)

$\log P_L/Pa = -4627/(T/K) + 12.52$ (supercooled liquid, FAV final adjusted eq., Li et al. 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated *, are compiled at the end of this section):

40.8 (concn ratio-GC, Murphy et al. 1983)

8.61 ($20^{\circ}C$, gas stripping-GC, Murphy et al. 1987)

- 11.75 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)
 12.73 (calculated-QSPR, Dunnivant et al. 1992)
 3.94 (calculated-QSPR, Achman et al. 1993)
 36.12* \pm 1.0 (gas stripping-GC, measured range 4–31°C, Bamford et al. 2000)
 $\ln K_{AW} = 15.877 - 5989.9/(T/K)$; temp range 4–31°C (gas stripping-GC, Bamford et al. 2000)
 $K_{AW} = \exp[-(49.8/\text{kJ}\cdot\text{mol}^{-1})/RT] + (0.132/\text{kJ}\cdot\text{mol}^{-1}\cdot\text{K}^{-1})/R$; where $R = 8.314 \text{ J}\cdot\text{K}^{-1}\cdot\text{mol}^{-1}$ and temp range: 4–31°C, (gas stripping-GC, Bamford et al. 2000)
 36.3 (exptl. data, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 50 \pm 6 \text{ kJ/mol}$, $\Delta S_H = 0.13 \pm 0.02 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004
 32.36, 14.45 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)
 $\log H/(\text{Pa m}^3/\text{mol}) = -2699/(T/K) + 10.56$ (LDV linear regression of literature data, Li et al. 2003)
 $\log H/(\text{Pa m}^3/\text{mol}) = -3289/(T/K) + 12.19$ (FAV final adjusted eq., Li et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 7.42 (HPLC-RT correlation, Shaw & Connell 1982)
 6.66, 7.12 (HPLC- k' correlation, Rapaport & Eisenreich 1984)
 6.57 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)
 6.74 (calculated-TSA, Hawker & Connell 1988a)
 6.24 (generator column-GC, Larsen et al. 1992)
 6.57 (recommended, Sangster 1993)
 6.49 (generator column-GC/ECD, Yeh & Hong 2002)
 6.49, 6.69 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ as or as indicated and reported temperature dependence. Additional data at other temperatures designated * are compiled at the end of this section:

- 10.08* (20°C, generator column-GC, measured range –10 to 30°C, Harner & Bidleman 1996)
 $\log K_{OA} = -5.92 + 4693/(T/K)$; temp range –10 to 30°C (generator column-GC, Harner & Bidleman 1996)
 11.13, 10.04; 10.02 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 9.86 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)
 9.80, 9.36 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)
 $\log K_{OA} = 4646/(T/K) - 6.22$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 3.60–5.19 (various marine species, mean dry weight, Hope et al. 1998)
 5.43 (Baltic Sea blue mussels, flow-through exptl, dry wt., Gustafsson et al. 1999)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.16 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 4.88 (as $\log K_h$, association coefficient with marine humic substance, calculated- χ , Sabljic et al. 1989)
 5.81 (soil from Ispra near Lake Maggiore, Italy, batch equilibrium-GC/ECD, Paya-Perez et al. 1991)
 5.20 (colloids and micro-particulates, GC/ECD, Murray & Andren 1992)
 5.80 (calculated- K_{OW} , Girvin & Scott 1997)
 5.52 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)
 4.79–7.42 (range, calculated from sequential desorption of 11 urban soils; Krauss & Wilcke 2001)
 5.46; 6.03, 6.67, 6.26 (20°C, batch equilibrium, A2 alluvial grassland soil; calculated values of exptl 1,2,3-solvophobic approach, Krauss & Wilcke 2001)
 6.16–7.20 (field contaminated sediment, initial-final values for 2–1461 d contact time, gas-purge technique-GC/ECD, ten Hulscher et al. 2003)

Sorption Partition Coefficient, $\log K_p$ of $\log K_d$:

- 5.55–5.82 (field-generated particulates, New Bedford Harbor, Bergen et al. 1993)
 5.40 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference: $k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987) $k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2): $k_2 = 0.034 \text{ d}^{-1}$ with an elimination $t_{1/2} = 20.3 \text{ d}$ (earthworm, Belfroid et al. 1995) $k_2 = 0.007 \text{ d}^{-1}$ with $t_{1/2} = 103 \text{ d}$ and $k_2 = 0.013 \text{ d}^{-1}$ with $t_{1/2} = 53 \text{ d}$ for food concn of 20 ng/g and 133 ng/g respectively in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998) $k_1 = 14 \text{ L d}^{-1} \text{ g}^{-1}$ dry wt.; $k_2 = 0.052 \text{ d}^{-1}$ (Baltic Sea blue mussels, flow-through expt., Gustafsson et al. 1999) $k_2 = 0.052 \text{ d}^{-1}$ (Baltic Sea blue mussels, flow-through expt., Gustafsson et al. 1999) $k_1 = 6$ (food lipid mg)/(g worm lipid-d); $k_2 = 0.06 \text{ d}^{-1}$ (earthworm, Wågman et al. 2001) $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 180 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004) $k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 225 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: reported biological half-lives: $t_{1/2} = 155$ to $> 1000 \text{ d}$ for trout, $t_{1/2} = 62\text{--}101 \text{ d}$ for trout muscle; $t_{1/2} = 73$ to $> 200 \text{ d}$ for carp for pentachlorobiphenyls (Niimi 1987);elimination $t_{1/2} = 20.3 \text{ d}$ from earthworm (Belfroid et al. 1995)elimination $t_{1/2} = 95 \text{ d}$ in rainbow trout, based on 228 d of elimination (Coristine et al. 1996)depuration $t_{1/2} = 53\text{--}103 \text{ d}$ in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

theoretical half-life to reach 90% steady-state tissue concn 13.3 d (Baltic Sea blue mussels, flow-through expt., Gustafsson et al. 1999);

elimination $t_{1/2} = 12 \text{ d}$ in earthworm given contaminated food (predicted, Wågman et al. 2001).depuration $t_{1/2} = 180 \text{ d}$ for high-dose treatment, $t_{1/2} = 225 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

TABLE 7.1.1.118.1

Soil:

Biota:

7.1.1.120 2,3',4,5,5'-Pentachlorobiphenyl (PCB-120)

Common Name: 2,3',4,5,5'-Pentachlorobiphenyl

Synonym: PCB-120, 2,3',4,5,5'-pentachloro-1,1'-biphenyl

Chemical Name: 2,3',4,5,5'-pentachlorobiphenyl

CAS Registry No: 68194-12-7

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

77 (Shiu & Mackay 1986)

77, 93 (exptl., estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F:

0.306 (assuming $\Delta S_{fus} = 56 J/mol K$, Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0295 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00259 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.42×10^{-3} (P_L supercooled liquid, Burkhard et al. 1985a)

0.00735, 0.00155, 0.000352 (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

0.00197, 0.00203 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P/mmHg) = 11.0 - 4780/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

$\log(P_L/Pa) = -4688/(T/K) + 13.02$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

15.71 (calculated-P/C, Burkhard 1984)

40.94 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

6.57 (wetted wall column-GC/ECD, Brunner et al. 1990)

24.87 (calculated-QSPR, Dunnivant et al. 1992)

36.7 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 56 \pm 17 kJ/mol$, $\Delta S_H = 0.15 \pm 0.01 kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.22, 5.68 (HPLC- k' correlation, uncorrected, with ortho correction, Rapaport & Eisenreich 1984)

6.41 (calculated-TSA, Burkhard 1984)

5.68 (quoted, Sangster 1993)

6.79 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.772 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.87 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.32 (suspended particulate matter, Burkhard 1984)

4.862 (marine humic substances with 5 mg/L DOC, reported as association coefficient $\log K_h$, calculated-MCI $^1\chi$, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$21.02^* \pm 0.83$ (gas stripping-GC, measured range $4-31^{\circ}C$, Bamford et al. 2000)

$\ln K_{AW} = 35.001 - 11847.5/(T/K)$; temp range $4-31^{\circ}C$ (gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(98.5/kJ \cdot mol^{-1})/RT] + (0.291/kJ \cdot mol^{-1} \cdot K^{-1})/R$; where $R = 8.314 J \cdot K^{-1} \cdot mol^{-1}$ and temp range: $4-31^{\circ}C$, (gas stripping-GC, Bamford et al. 2000)

21.3 (exptl. data, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 99 \pm 9$ kJ/mol, $\Delta S_H = 0.29 \pm 0.03$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.38 (calculated-TSA, Burkhard 1984)

- 6.57 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)
 6.89 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)
 6.6729 (calculated-molecular properties MNDO-AM1 method, Makino 1998)
 6.56; 6.62 (generator column-GC/ECD, calculated-QSPR, Yeh & Hong 2002)
 7.00, 6.67 (calculated-MCI χ , calculated-MNDO-AMI method, Yeh & Hong 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

- 10.61* (20°C, generator column-GC, measured range -10 to 30°C, Harner & Bidleman 1996)
 $\log K_{OA} = -5.98 + 4870/(T/K)$; temp range -10 to 30°C (generator column-GC, Harner & Bidleman 1996)
 11.77, 10.66; 10.61 (0, 20°C, GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 10.56 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 5.81, 7.35 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)

Biota Sediment Accumulation Factor BSAF:

- 43 (trout, Niimi 1996)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.18 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2-0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60-120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.3-0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16-48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 5 \text{ (food lipid mg)/(g worm lipid-d)}$; $k_2 = 0.05 \text{ d}^{-1}$ (earthworm, Wågman et al. 2001)

$k_2 = 0.0137 \text{ d}^{-1}$ with $t_{1/2} = 51 \text{ d}$ (newly contaminated oysters, Gardinali et al. 2004)

$k_2 = 0.0116 \text{ d}^{-1}$ with $t_{1/2} = 60 \text{ d}$ (chronically contaminated oysters, Gardinali et al. 2004)

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water: photodegradation $t_{1/2} = 304 \text{ min}$ when irradiated in a TiO_2 semiconductor aqueous suspensions with a 1.5-kW high pressure Xenon lamp (De Felip et al. 1996).

Ground water:

Sediment:

Soil:

Biota: reported biological half-lives for pentachlorobiphenyls: $t_{1/2} = 155$ to $> 1000 \text{ d}$ for trout, $t_{1/2} = 62-101 \text{ d}$ for trout muscle; $t_{1/2} = 73$ to $> 200 \text{ d}$ for carp (Niimi 1987);

elimination $t_{1/2} = 13 \text{ d}$ in earthworm given contaminated food (Wågman et al. 2001)

Depuration $t_{1/2} = 51 \text{ d}$ for newly contaminated oysters, and $t_{1/2} = 60 \text{ d}$ for chronically contaminated oysters (Gardinali et al. 2004)

TABLE 7.1.1.126.1

Reported aqueous solubilities, Henry's law constants and octanol-air partition coefficients of 3,3',4,4',5-pentachlorobiphenyl (PCB 126) at various temperatures and reported empirical temperature dependence equations

Aqueous solubility		Henry's law constant		log K _{OA}	
Huang & Hong 2002		Bamford et al. 2000		Harner & Bidleman 1996	
generator column-GC/ECD		gas stripping-GC/MS		generator column-GC	
t/°C	S/g·m ⁻³	t/°C	H/(Pa m ³ /mol)	t/°C	log K _{OA}
5	6.30 × 10 ⁻⁴	4	0.958	-10	12.55
15	9.64 × 10 ⁻⁴	11	2.82	0	11.81
25	1.33 × 10 ⁻³	18	7.88	10	11.24
35	1.60 × 10 ⁻³	25	21.02	20	10.61
		31	47.0	30	10.10
$\ln x = A - B/(T/K)$		$\ln K_{AW} = -\Delta H/RT + \Delta S/R$		$\Delta H_{OA}/(kJ\ mol^{-1}) = 93.25$	
A	x	$\Delta S/R$	35.012	$\log K_{OA} = A + B/T$	
B	$\Delta H_{sol}/R$	$\Delta H/R$	11847.5	A	-5.979
mp/°C	160–161	enthalpy, entropy change:		B	4870
$\Delta H_{sol}/(kJ\ mol^{-1}) = 22.3$		$\Delta H/(kJ\cdot mol^{-1}) = 98.5 \pm 9.4$			
		$\Delta S/(J\cdot mol^{-1}\cdot K^{-1}) = 291 \pm 32$			

FIGURE 7.1.1.126.1 Logarithm of mole fraction solubility, Henry's law constant and K_{OA} versus reciprocal temperature for 3,3',4,4',5-pentachlorobiphenyl (PCB-126).

7.1.1.127 3,3',4,5,5'-Pentachlorobiphenyl (PCB-127)

Common Name: 3,3',4,5,5'-Pentachlorobiphenyl

Synonym: PCB-127

Chemical Name: 3,3',4,5,5'-pentachlorobiphenyl

CAS Registry No: 39635-33-1

Molecular Formula: $C_{12}H_5Cl_5$

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

135 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

289.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0285 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.000651 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

4.04×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.000449 (GC-RI correlation, Burkhard et al. 1985b)

7.80×10^{-4} , 5.38×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -4956/(T/K) + 13.51$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

4.64 (calculated-P/C, Burkhard 1984)

34.45 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

12.73 (calculated-QSPR, Dunnivant et al. 1992)

21.3 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 99 \pm 9$ kJ/mol, $\Delta S_H = 0.29 \pm 0.03$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.42 (calculated-TSA, Burkhard 1984)

6.95 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.8023 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.53 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.22 (suspended particulate matter, Burkhard 1984)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference: $k_{OH}(\text{calc}) = (0.2\text{--}0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 60\text{--}120 \text{ d}$, due to gas-phase loss process at room temp. (Atkinson 1987) $k_{OH}(\text{calc}) = (0.3\text{--}0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for pentachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 16\text{--}48 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radical for pentachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 16–48 d based on the calculated rate constant for gas-phase reaction with OH radical for pentachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.128 2,2',3,3',4,4'-Hexachlorobiphenyl (PCB-128)

Common Name: 2,2',3,3',4,4'-Hexachlorobiphenyl

Synonym: PCB-128, 2,2',3,3',4,4'-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,4'-hexachlorobiphenyl

CAS Registry No: 38380-07-3

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

151 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.3482

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

237.4 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

28.83 (Miller et al. 1984)

29.20 (Ruelle et al. 1993; Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

68.62 (Miller et al. 1984; Shiu & Mackay 1986)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

0.0582 (Mackay et al. 1980; Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

4.40×10^{-4} (generator column-GC/ECD, Weil et al. 1974)

9.90×10^{-4} (shake flask-GC/ECD, Dexter & Pavlou 1978)

2.85×10^{-4} (generator column-GC/ECD, Miller et al. 1984,1985)

0.0067 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

2.74×10^{-3} , 2.17×10^{-3} , 9.07×10^{-4} , 1.54×10^{-3} (RP-HPLC- k' correlation, different stationary and mobile phase, Brodsky & Ballschmiter 1988)

0.0023 (generator column-GC, Dunnivant & Elzerman 1988)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

3.41×10^{-4} (supercooled liquid P_L , GC-RT correlation, Bidleman 1984)

3.67×10^{-4} , 2.94×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

9.83×10^{-5} ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

3.67×10^{-4} , 2.94×10^{-4} , 3.41×10^{-4} (supercooled liquid P_L , GC-RT correlation, Foreman & Bidleman 1985)

$\log(P/mmHg) = 11.40 - 5020/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

1.78×10^{-4} , 3.31×10^{-4} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4881/(T/K) + 12.91$ (GC-RT correlation, Falconer & Bidleman 1994)

$(2.90 - 154.0) \times 10^{-6}$; $(9.80 - 35.9) \times 10^{-5}$ (literature solid P_s range; supercooled liquid P_L range, Delle Site 1997)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

50.66 (calculated, Murphy et al. 1983)

6.85 (calculated-P/C, Burkhard et al. 1985b)

11.91 (calculated-P/C, Shiu & Mackay 1986)

- 5.78 (20°C, calculated-P/C, Murphy et al. 1987)
 3.04 (gas stripping-GC/ECD, Dunnivant & Elzerman 1988; Dunnivant et al. 1988)
 50.5 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)
 1.32 (wetted-wall column-GC/ECD, Brunner et al. 1990)
 10.51 (calculated-QSPR, Dunnivant et al. 1992)
 0.890, 3.224, 10.99, 35.40 \pm 1.5, 92.30 (4, 11, 18, 25, 31°C, gas stripping-GC, Bamford et al. 2000)
 $\ln K_{AW} = 43.30 - 14193/(T/K)$; temp range 4–31°C (gas stripping-GC, Bamford 2000)
 $K_{AW} = \exp[-(118.0/kJ\cdot mol^{-1})/RT] + (0.360/kJ\cdot mol^{-1}\cdot K^{-1})/R$; where $R = 8.314 J\cdot K^{-1}\cdot mol^{-1}$ and temp range: 4–31°C, (gas stripping-GC, Bamford et al. 2000)
 32.7 (exptl. data, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 118 \pm 8 kJ/mol$, $\Delta S_H = 0.36 \pm 0.03 kJ/mol\cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 7.44 (RP-TLC-RT correlation, Bruggeman et al. 1982)
 6.98 (generator column-GC/ECD, Miller et al. 1984, 1985)
 6.14 (HPLC-RT correlation, Rapaport & Eisenreich 1984)
 6.28 (HPLC-RP/MS correlation, Burkhard et al. 1985c)
 6.50, 6.67, 6.83, 6.73 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 6.98 (generator column-GC/ECD, Doucette & Andren 1988)
 7.24 (calculated-UNIFAC activity coefficients, Banerjee & Howard 1988)
 7.321 ± 0.027 (shake flask/slow stirring-GC/ECD, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
 6.98, 6.87; 6.92, 6.87 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)
 6.71 (HPLC- k' correlation, Neogrohati & Hammers 1992)
 6.62 (generator column-GC, Larsen et al. 1992)
 6.96 (recommended, Sangster 1993)
 7.32 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 9.93 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 1.0 (poultry, Garten & Trabalka 1983)
 4.28 (worms, Oliver 1987c)
 5.77; 7.30 (22°C, zebrafish: $\log BCF_w$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)
 3.20–5.12 (various marine species, mean dry wt. BCF, Hope et al. 1998)
 4.90–6.03 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)
 5.77, 7.31 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)
 5.41, 7.48 (mussel *Mytilus edulis*: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.05 (calculated-MCI, Koch 1983)
 6.42 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 5.06 (calculated-MCI, Bahnick & Doucette 1988)
 5.26 (marine humic substance, calculated-MCI χ , reported as $\log K_h$ at 5 mg/L DOC, Sabljic et al. 1989)
 6.28, 6.17, 6.01 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)
 6.0 (colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
 5.05 (soil, calculated-MCI, Sabljic et al. 1995)
 5.93 (soil, calculated-Characteristic Root Index [CRI], Saçan & Balcioğlu 1996)
 6.50 (soil, calculated- K_{OW} , Girvin & Scott 1997)
 6.00; 5.10 (soil, calculated-universal solvation model; quoted lit., Winget et al. 2000)

Sorption Partition Coefficient, $\log K_{OM}$:

5.05, 5.09 (quoted, calculated-MCI χ , Sabljic 1984)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29\text{--}60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Photooxidation: calculated room temp. rate constant for hexachlorobiphenyls is $(0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for gas-phase reaction with OH radicals, the tropospheric lifetime is calculated to be $29\text{--}60 \text{ d}$ (Kwok et al. 1996).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 > 0.0007 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)

$k_1 = 4970 \text{ d}^{-1}$; $k_2 = 0.00843 \text{ d}^{-1}$ (22°C , zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.009 \text{ d}^{-1}$ with $t_{1/2} = 75 \text{ d}$ and $k_2 = 0.012 \text{ d}^{-1}$ with $t_{1/2} = 59 \text{ d}$ for food concn of 8 ng/g and 99 ng/g, respectively, in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 146 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 205 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of $29\text{--}90 \text{ d}$ based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} > 1000 \text{ d}$ in rainbow trout, and $t_{1/2} = 89 \text{ d}$ in its muscle (Niimi & Oliver 1983).

Depuration $t_{1/2} = 59\text{--}75 \text{ d}$ in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

depuration $t_{1/2} = 146 \text{ d}$ for high-dose treatment, $t_{1/2} = 205 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

7.1.1.129 2,2',3,3',4,5-Hexachlorobiphenyl (PCB-129)

Common Name: 2,2',3,3',4,5-Hexachlorobiphenyl

Synonym: PCB-129, 2,2',3,3',4,5-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,5-hexachlorobiphenyl

CAS Registry No: 55215-18-4

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

85 (Mackay et al. 1980; Bruggeman et al. 1982; Burkhard et al. 1985a; Opperhuizen et al. 1988; Brodsky & Ballschmiter 1988; Kühne et al. 1995; Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.3482

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point,)

237.4 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

0.256 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.00085 (generator column-GC/ECD, Weil et al. 1974)

0.0117 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.00150, 0.00198, 0.000688, 0.00169 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.00582 (generator column-GC/ECD, Dunnivant & Elzerman 1988)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

5.76×10^{-4} (GC-RI correlation, Burkhard et al. 1985a)

0.00208 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

4.68×10^{-4} (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4816/(T/K) + 12.80$ (supercooled liquid, GC-RT correlation, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

39.52 (calculated-P/C, Burkhard et al. 1985b)

8.61 (calculated-MCI χ , Sabljic & Güsten 1989)

2.94 (wetted-wall column-GC, Brunner et al. 1990)

14.18 (calculated-QSPR, Dunnivant et al. 1992)

49.5 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 79 \pm 18\ kJ/mol$, $\Delta S_H = 0.23 \pm 0.06\ kJ/mol\cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.50 (HPLC-RT correlation, Rapaport & Eisenreich 1984)

6.71, 6.71, 6.90, 6.71 (RP-HPLC- k' correlations, Brodsky & Ballschmiter 1988)

6.94, 6.70; 6.81, 6.83 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

- 6.76 (recommended, Sangster 1993)
 7.32 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 9.80 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.42 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 5.259 (marine humic substance, calculated-MCI χ , reported as association coefficient $\log K_h$ at 5 mg/L DOC, Sabljic 1989)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 156 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 166 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 156 \text{ d}$ for high-dose treatment, $t_{1/2} = 166 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.130 2,2',3,3',4,5'-Hexachlorobiphenyl (PCB-130)

Common Name: 2,2',3,3',4,5'-Hexachlorobiphenyl

Synonym: PCB-130, 2,2',3,3',4,5'-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,5'-hexachlorobiphenyl

CAS Registry No: 52663-66-8

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

96 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.51 (suspended particulate matter, Burkhard 1984)

5.100 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29\text{--}60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.132 2,2',3,3',4,6'-Hexachlorobiphenyl (PCB-132)

Common Name: 2,2',3,3',4,6'-Hexachlorobiphenyl

Synonym: PCB-132, 2,2',3,3',4,6'-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,6'-hexachlorobiphenyl

CAS Registry No: 38380-05-1

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

81 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0149 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00808 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.00720 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.155×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

1.27×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

7.58×10^{-4} , 9.08×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

5.62×10^{-4} , 1.0×10^{-3} (supercooled liquid P_L : GC-RI correlations, different stationary phase, Fischer et al. 1992)

$\log(P_L/Pa) = -4681/(T/K) + 12.5$, (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

27.97 (calculated-P/C, Burkhard 1984)

16.31 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

4.46 (wetted wall column-GC/ECD, Brunner et al. 1990)

2.42 (calculated-QSPR, Achman et al. 1993)

20.55 (calculated-QSPR, Dunnivant et al. 1992)

16.6 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

59.4 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 61 \pm 7\ kJ/mol$, $\Delta S_H = 0.17 \pm 0.02\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.70 (HPLC-RT correlation, Shaw & Connell 1982)

6.20 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.09, 6.77; 6.63, 6.58 (multi-column-HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

6.20 (recommended, Sangster 1993)

7.04 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

11.16, 10.07; 9.96 (0, 20°C, multi-column GC-k' correlation; calculated at 20°C, Zhang et al. 1999)
9.76 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.52 (suspended particulate matter, Burkhard 1984)
5.10 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)
6.40 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 136 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 147 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29-90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 136 \text{ d}$ for high-dose treatment, $t_{1/2} = 147 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.133 2,2',3,3',5,5'-Hexachlorobiphenyl (PCB-133)

Common Name: 2,2',3,3',5,5'-Hexachlorobiphenyl

Synonym: PCB-133, 2,2',3,3',5,5'-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',5,5'-hexachlorobiphenyl

CAS Registry No: 35694-04-3

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

129 (Burkhard et al. 1985b)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0954 (mp at $129^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0149 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00181 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

4.37×10^{-4} (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

7.98×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

8.24×10^{-5} (GC-RI correlation, Burkhard et al. 1985b)

8.43×10^{-4} , 0.00110 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -4816/(T/K) + 13.08$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

19.25 (calculated-P/C, Burkhard 1984)

33.84 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

20.64 (calculated-QSPR, Dunnivant et al. 1992)

49.5 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 79 \pm 18$ kJ/mol, $\Delta S_H = 0.23 \pm 0.06$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.72 (calculated-TSA, Burkhard 1984)

6.86 (calculated-TSA, Hawker & Connell 1988a)

6.97, 7.02; 6.66, 6.60 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

6.63, 7.00 (quoted average values of GC-RV and HPLC- k' correlations of Risby et al. 1990, Sangster 1993)

7.07 (recommended, Hansch et al. 1995)

6.7470 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

7.69 (calculated-CLOGP ver. 4, Ran et al. 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.57 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.52 (suspended particulate matter, Burkhard 1984)

5.222 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Melting Point ($^{\circ}C$):

112.05 (differential scanning calorimetry, Miller et al. 1984)

114.2 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

237.4 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

21.21 (differential scanning calorimetry, Miller et al. 1984)

21.10 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

54.81 (Miller et al. 1984)

Fugacity Ratio at $25^{\circ}C$, F :

0.138 (calculated, assuming $\Delta S_{fus} = 56\ J/mol\ K$, Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.00099 (shake flask-GC/ECD, Dexter & Pavlou 1978)

0.00603 (generator column-GC/ECD, Miller et al. 1984)

0.00451* (generator column-GC/ECD, measured range $4-32^{\circ}C$, Dickhut et al. 1986)

1.10×10^{-3} , 3.25×10^{-3} , 4.51×10^{-3} , 6.68×10^{-3} ($4, 20, 25, 32^{\circ}C$, generator column-GC/ECD, Dickhut et al. 1986)

$\ln x = -5484.72/(T/K) - 3.8682$; temp range $4-32^{\circ}C$, $\Delta H_{ss} = 45.6\ kJ/mol$ (generator column-GC/ECD, Dickhut et al. 1986)

$\log x = -2378/(T/K) - 1.679$, $\Delta H_{ss} = 45.5\ kJ/mol$ (regression eq. given by Doucette & Andren 1988, based on exptl data of Dickhut et al. 1986); or

$S/(mol/L) = 2.39 \times 10^{-9} \exp(0.065 \cdot t/^{\circ}C)$ (regression eq. given by Doucette & Andren 1988, based on exptl data of Dickhut et al. 1986)

0.0202 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

$\ln x = -3.880235 - 5471.2/(T/K)$, temp range $5-50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.000531 (GC-RI correlation, Burkhard et al. 1985a)

0.00374 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

0.00156, 0.00292 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

0.00127 ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.00158, 0.00331 (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log (P_L/Pa) = -4303/(T/K) + 11.63$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated):

- 93.22 (calculated-P/C, Burkhard et al. 1985b; quoted, Eisenreich 1987)
- 22.79 (20°C, calculated-P/C, Murphy et al. 1987)
- 25.54 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)
- 8.92 (wetted-wall column-GC/ECD, Brunner et al. 1990)
- 32.64 (calculated-QSPR, Dunnivant et al. 1992)
- 45.4 (11°C, gas stripping-GC/ECD, Bamford et al. 2002)
- 81.5 (from 11°C exptl. data and compensation point, Bamford et al. 2002)
- $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 27 \pm 5$ kJ/mol, $\Delta S_H = 0.06 \pm 0.02$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, log K_{OW}:

- 8.35 (Hansch & Leo 1979)
- 6.81 (generator column-HPLC, Woodburn et al. 1984)
- 6.63 (generator column-GC/ECD, Miller et al. 1984)
- 4.91 (RP-HPLC-RT correlation, Rapaport & Eisenreich 1984)
- 5.48 (HPLC-RP/MS correlation, Burkhard et al. 1985c)
- 6.81 (generator column-GC/ECD, Doucette & Andren 1987, 1988)
- 5.76 (generator column-GC/ECD, Hawker & Connell 1988a)
- 7.118 ± 0.034 (shake flask/slow stirring-GC, De Bruijn et al. 1989; De Bruijn & Hermens)
- 7.18 (calculated- π const., De Bruijn et al. 1989)
- 6.63, 6.30; 6.30, 6.24 (multi-column HPLC-k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)
- 7.50 (calculated-UNIFAC activity coefficient, Dallos et al. 1993)
- 6.54 (recommended, Sangster 1993)
- 7.12 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C or as indicated:

- 10.59, 9.53; 9.58 (0, 20°C, multi-column GC-k' correlation; calculated at 20°C, Zhang et al. 1999)
- 9.51 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF at 25°C or as indicated:

- 0.86 (poultry, Garten & Trabalka 1983)
- 5.43; 6.96 (22°C, zebrafish: log BCF_w wet wt basis; log BCF_L lipid wt basis, Fox et al. 1994)
- 5.43, 6.96 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, log K_{OC}:

- 6.53 (suspended particulate matter, calculated-K_{OW}, Burkhard 1984)
- 6.53 (suspended solids, 0.7 mg/L, 43.2% OC-Lake Michigan, sorption isotherm, Voice & Weber 1985)
- 5.68 (suspended solids, 6.5 mg/L, 14.8% OC-Lake Michigan, sorption isotherm, Voice & Weber 1985)
- 4.95, 5.05, 4.95, 4.27 (marine humic substances in concentrations of 5, 10, 20, 40 mg L of DOC, reported as association coefficient log K_h, Lara & Ernst 1989)
- 4.952, 4.942 (marine humic substances with 5 mg/L DOC, reported as association coefficient log K_h. Observed; calculated-MCI χ , Sabljic et al. 1989)
- 6.01, 6.06, 5.90 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)
- 6.04 (5.73–6.35) (sediment: organic carbon OC ≥ 0.5%, average, Delle Site 2001)

Environmental Fate Rate Constants, k, or Half-Lives, t_{1/2}:

Volatilization:

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO₃} with NO₃ radical and k_{O₃} with O₃ or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60$ d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: 18% at 24 h and 33% degradation at 72 h in one of the PCB mixture including congeners ranging from di- to hexa-PCBs with several structure classes, by microorganism *Alcaligenes eutrophus* H850 (Bedard et al. 1986).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 4390 \text{ d}^{-1}$; $k_2 = 0.0181 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 132 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 144 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water: photodegradation $t_{1/2} = 15.0 \text{ min}$ when irradiated in a TiO_2 semiconductor aqueous suspensions with a 1.5-kW high pressure Xenon lamp (De Felip et al. 1996)

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 132 \text{ d}$ for high-dose treatment, $t_{1/2} = 144 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.137 2,2',3,4,4',5-Hexachlorobiphenyl (PCB-137)

Common Name: 2,2',3,4,4',5-Hexachlorobiphenyl

Synonym: PCB-137, 2,2',3,4,4',5-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,4',5-hexachlorobiphenyl

CAS Registry No: 35694-06-5

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

78.0 (Burkhard et al. 1985b)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.302 (mp at $78^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.0158 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.0084 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

9.94×10^{-4} , 1.12×10^{-3} , 7.54×10^{-4} , 1.69×10^{-3} (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.00228 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

1.71×10^{-3} (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.41×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

7.83×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

1.50×10^{-4} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

3.80×10^{-4} , 3.02×10^{-4} (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4816/(T/K) + 12.61$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

55.02 (calculated-P/C, Burkhard 1984)

6.89 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

21.08 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

18.82 (calculated-QSPR, Dunnivant et al. 1992)

3.13 (calculated-QSPR, Achman et al. 1993)

13.0 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

55.0 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 69 \pm 8$ kJ/mol, $\Delta S_H = 0.20 \pm 0.03$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

> 6.89, > 7.71 (RP-HPLC- k' correlation; uncorrected, with ortho correction, Rapaport & Eisenreich 1984)

7.46 (HPLC-RT correlation, De Kock & Lord 1987)

- 6.84, 6.87, 6.88, 6.71 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 6.97, 7.06; 6.82, 6.78 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)
 6.83 (recommended, Sangster 1993)
 7.25 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 9.89 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.49 (suspended particulate matter, Burkhard 1984)
 5.241 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)
 6.30 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
 5.94 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

- $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 186 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 191 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 186 \text{ d}$ for high-dose treatment, $t_{1/2} = 191 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.138 2,2',3,4,4',5'-Hexachlorobiphenyl (PCB-138)

Common Name: 2,2',3,4,4',5'-Hexachlorobiphenyl

Synonym: PCB-138, 2,2',3,4,4',5'-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,4',5'-hexachlorobiphenyl

CAS Registry No: 35065-28-2

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

79 (Hutzinger et al. 1974; Brodsky & Ballschmiter 1988)

80.5 (Kühne et al. 1995; Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point, Shiu & Mackay 1986)

 7.00, 7.22 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

10.09* (20°C, generator column-GC, measured range -10 to 30°C, Harner & Bidleman 1996)
 $\log K_{OA} = -5.57 + 4584/(T/K)$; temp range -10 to 30°C (generator column-GC, Harner & Bidleman 1996)
 9.51; 9.12 (fugacity meter/generator column-GC; calculated, Kömp & McLachlan 1997a)
 $\log K_{OA} = -5.17 + 4380/(T/K)$; temp range 10–43°C (fugacity meter, Kömp & McLachlan 1997a)
 10.62 (10°C, estimated, Thomas et al. 1998)
 11.34, 10.20; 10.18 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 10.09 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)
 9.76, 9.66 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)

$\log K_{OA} = 4509/(T/K) - 5.37$ (LDV linear regression of literature data, Li et al. 2003)

$\log K_{OA} = 4510/(T/K) - 5.47$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, log BCF:

5.88; 7.41 (zebrafish: log BCF_w wet wt basis; log BCF_L lipid wt basis, Fox et al. 1994)

3.31–5.47 (various marine species, mean dry wt. BCF, Hope et al. 1998)

4.79–5.96 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)

5.88, 7.42 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)

5.42, 7.48 (mussel *Mytilus edulis*: wet wt basis, lipid wt basis, Geyer et al. 2000)

Partition Coefficient between particulate and dissolved contaminant concentrations, log K_p or log K_d

5.80, 5.30 (Lake Superior suspended solids, concn ratio-GC/ECD, Baker et al. 1986)

5.70 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

5.52–5.89 (field-generated particulates, New Bedford Harbor, Bergen et al. 1993)

Sorption Partition Coefficient, log K_{OC} at 25°C or as indicated:

6.49 (suspended particulate matter, calculated-K_{OW}, Burkhard 1984)

5.8–7.3, 6.6 (suspended sediment, average, Oliver 1987a)

7.60 (algae > 50 µm, Oliver 1987a)

6.65 (Lake Michigan water column, Swackhamer & Armstrong 1987)

5.21, 5.22, 5.17, 4.60 (marine humic substances, in concentrations of 5, 10, 20, 40 mg/L DOC, reported as association coefficient log K_h, Lara & Ernst 1989)

5.207, 5.241 (marine humic substances, quoted, calculated-MCI χ, reported as log K_h at 5 mg/L DOC, Sabljic et al. 1989)

5.93 (soil from Ispra, shake flask-GC, Paya-Perez et al. 1991; quoted, Baker et al. 2000)

6.50 (colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

6.50 (soil, calculated-K_{OW}, Girvin & Scott 1997)

6.04–7.28; 5.80–7.30 (range, calculated from sequential desorption of 11 urban soils; lit. range, Krauss & Wilcke 2001)

5.51; 6.28, 6.78, 6.41 (20°C, batch equilibrium, A2 alluvial grassland soil; calculated values of expt 1,2,3-solvophobic approach, Krauss & Wilcke 2001)

6.27–7.44 (field contaminated sediment, initial-final values for 2–1461 d contact time, gas-purge technique-GC/ECD, ten Hulscher et al. 2003)

Environmental Fate Rate Constants, k, or Half-Lives, t_{1/2}:

Volatilization:

Photolysis: photodegradation rate constant k = (0.08 ± 0.01) h⁻¹ with t_{1/2} = 8.2 h in aqueous solution with the presence of diethylamine after exposure to simulated sunlight (Lin et al. 1995).

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO3} with NO₃ radical and k_{O3} with O₃ or as indicated, *data at other temperatures see reference:

k_{OH}(calc) = (0.16–0.5) × 10⁻¹² cm³ molecule⁻¹ s⁻¹ for hexachlorobiphenyls, and the tropospheric lifetime τ(calc) = 29–60 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k₁) and Elimination (k₂) Rate Constants:

k₁ = 0.049 h⁻¹; k₂ = 0.008 h⁻¹ (mayfly-sediment model II, Gobas et al. 1989)

k₁ = 4770 d⁻¹; k₂ = 0.00624 d⁻¹ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)

k₂ = 0.0344 d⁻¹ with an elimination t_{1/2} = 20.2 d (earthworm, Belfroid et al. 1995)

k₂ = 0.005 d⁻¹ with t_{1/2} = 139 d and k₂ = 0.011 d⁻¹ with t_{1/2} = 64 d for food concn of 31 ng/g and 176 ng/g, respectively, in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

k₁ = 0.00226 h⁻¹; k₂ = 0.145 h⁻¹ (blood plasma of ring doves, Drouillard & Norstrom 2000)

$k_1(\text{calc}) = 5 \text{ (food lipid mg)/(g worm lipid-d)}$; $k_2(\text{calc}) = 0.05 \text{ d}^{-1}$ (earthworm, Wågman et al. 2001)
 $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 186 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 191 \text{ d}$ (8°C , juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995);

$t_{1/2} = 6000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: photodegradation $t_{1/2} = (8.2 \pm 0.3) \text{ h}$ in aqueous solution with the presence of diethylamine after exposure to simulated sunlight (Lin et al. 1995);

$t_{1/2} = 120000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: $t_{1/2} = 19\text{--}25 \text{ yr}$ (Geyer et al. 2000)

$t_{1/2} = 165000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: $t_{1/2} = 165000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: elimination $t_{1/2}$ = of 20.d from earthworm (Belfroid et al. 1995)

Depuration $t_{1/2} = 64\text{--}139 \text{ d}$ in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

$t_{1/2} = 4.8 \text{ h}$ in blood plasma (ring doves, Drouillard & Norstrom 2000);

elimination $t_{1/2} = 13 \text{ d}$ in earthworm given contaminated food (predicted, Wågman et al. 2001)

depuration $t_{1/2} = 186 \text{ d}$ for high-dose treatment, $t_{1/2} = 191 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C , juvenile rainbow trout, Buckman et al. 2004)

TABLE 7.1.1.138.1
Reported Henry's law constants and octanol-air partition coefficients of 2,2',3,4,4',5'-hexachlorobiphenyl (PCB-138) at various temperatures and temperature dependence equations

Henry's law constant		log K _{OA}					
Bamford et al. 2000		Harner & Bidleman 1996		Kömp & McLachlan 1997		Zhang et al. 1999	
gas stripping-GC/MS		generator column-GC		fugacity meter-GC/MS		multicolumn-GC-k' correlation	
t/°C	H/(Pa m ³ /mol)	t/°C	log K _{OA}	t/°C	log K _{OA}	t/°C	log K _{OA}
4	2.88	−10	11.81	25	9.51	0	11.34

FIGURE 7.1.1.138.1 Logarithm of Henry's law constant and K_{OA} versus reciprocal temperature for 2,2',3,4,4',5'-hexachlorobiphenyl (PCB-138).

7.1.1.139 2,2',3,4,4',6-Hexachlorobiphenyl (PCB-139)

Common Name: 2,2',3,4,4',6-Hexachlorobiphenyl

Synonym: PCB-139

Chemical Name: 2,2',3,4,4',6-hexachlorobiphenyl

CAS Registry No: 56030-56-9

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

123 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0126 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00228 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

3.05×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

2.65×10^{-3} , 3.30×10^{-3} , 2.33×10^{-4} (P_L supercooled liquid values: calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

1.26×10^{-3} (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4681/(T/K) + 12.78$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

87.24 (calculated-P/C, Burkhard 1984)

38.60 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

33.32 (calculated-QSPR, Dunnivant et al. 1992)

68.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 47 \pm 8$ kJ/mol, $\Delta S_H = 0.13 \pm 0.03$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.79 (calculated-TSA, Burkhard 1984)

6.67 (calculated-TSA, Hawker & Connell 1988a)

7.12, 6.68; 6.54, 6.50 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

6.70 (recommended, Sangster 1993)

6.95 (recommended, Hansch et al. 1995)

6.6419 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.17 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

6.59 (suspended particulate matter, Burkhard 1984)

5.083 (marine humic substances 5 mg/L of DOC, reported as association coefficient log K_h , calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.140 2,2',3,4,4',6'-Hexachlorobiphenyl (PCB-140)

Common Name: 2,2',3,4,4',6'-Hexachlorobiphenyl

Synonym: PCB-140, 2,2',3,4,4',6'-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,4',6'-hexachlorobiphenyl

CAS Registry No: 59291-64-4

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

123 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0125 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00314, 0.00203, 0.0015, 0.00194 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.00228 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.00325 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$):

1.26×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00138 (GC-RI correlation, Burkhard et al. 1985b)

Henry's Law Constant (Pa- m^3/mol at $25^{\circ}C$):

36.38 (calculated-P/C, Burkhard 1984)

43.06 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

31.17 (calculated-QSAR, Dunnivant et al. 1992)

68.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 47 \pm 8$ kJ/mol, $\Delta S_H = 0.13 \pm 0.03$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.79 (calculated-TSA, Burkhard 1984)

6.48, 6.70, 6.47, 6.66 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

6.67 (calculated-TSA, Hawker & Connell 1988a)

7.01, 6.86; 6.56, 6.51 (multicolumn HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

6.58 (recommended, Sangster 1993).

6.97 (recommended, Hansch et al. 1995)

6.4851 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.91 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

6.59 (suspended particulate matter, Burkhard 1984)

5.083 (marine humic substances 5 mg/L of DOC, reported as association coefficient log K_h , calc-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29\text{--}60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

7.1.1.141 2,2',3,4,5,5'-Hexachlorobiphenyl (PCB-141)

Common Name: 2,2',3,4,5,5'-Hexachlorobiphenyl

Synonym: PCB-141, 2,2',3,4,5,5'-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,5,5'-hexachlorobiphenyl

CAS Registry No: 52712-04-6

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

85 (Kühne et al. 1995; Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

237.4 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.258 (mp at $85^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.0160 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00755 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.00109, 0.00150, 0.00134, 0.00165 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.00287 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.0025 (calculated-group contribution method, Kühne et al. 1995)

0.00244, 0.00642 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.73×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00295 (GC-RI correlation, Burkhard et al. 1985b)

2.05×10^{-4} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

$\log(P/mmHg) = 11.50 - 5080/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

5.01×10^{-4} , 6.46×10^{-4} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4816/(T/K) + 12.94$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

61.5 (calculated-P/C, Burkhard 1984)

9.83 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

14.49 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

2.33 (wetted wall column-GC/ECD, Brunner et al. 1990)

17.61 (calculated-QSPR, Dunnivant et al. 1992)

6.54 (calculated-QSPR, Achman et al. 1993)

12.7 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

54.5 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 70 \pm 7$ kJ/mol, $\Delta S_H = 0.20 \pm 0.03$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 6.69 (calculated-TSA, Burkhard 1984)
- 6.80, 6.79, 6.79, 6.71 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 6.82 (calculated-TSA, Hawker & Connell 1988a)
- 6.98, 7.02; 6.78, 6.73 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)
- 6.75 (recommended, Sangster 1993)
- 9.538 (calculated-UNIFAC group contribution, Chen et al. 1993)
- 7.19 (recommended, Hansch et al. 1995)
- 7.10, 6.64–6.89 (calculated-Characteristic Root Index CRI; min.-max. range, Saçan & Inel 1995)
- 6.70 (estimated, Girvin & Scott 1997)
- 6.8226 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 10.55 (10°C, estimated, Thomas et al. 1998)
- 11.18, 10.07; 10.13 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
- 9.87 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 5.81; 7.34 (zebrafish: $\log BCF_w$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

- 5.80, 5.10 (Lake Superior suspended solids, concn ratio-GC/ECD, Baker et al. 1986)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.49 (suspended particulate matter, Burkhard 1984)
- 5.241 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)
- 6.05 (Ispra soil, shake flask-GC, Paya-Perez et al. 1991)
- 6.20 (soil-organic carbon, calculated- K_{ow} , Girvin & Scott 1997)
- 6.02 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29\text{--}60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

- $k_1 = 4910 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)
- $k_2 = 0.00764 \text{ d}^{-1}$ (22°C, zebrafish, 30-d clearance, Fox et al. 1994)
- $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 171 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
- $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 198 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 171$ d for high-dose treatment, $t_{1/2} = 198$ d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.142 2,2',3,4,5,6-Hexachlorobiphenyl (PCB-142)

Common Name: 2,2',3,4,5,6-Hexachlorobiphenyl

Synonym: PCB-142, 2,2',3,4,5,6-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,5,6-hexachlorobiphenyl

CAS Registry No: 41411-61-4

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

136.0 (Burkhard et al. 1985b)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0815 (mp at $136^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0171 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00361 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.00138 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$):

3.41×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.000293 (GC-RI correlation, Burkhard et al. 1985b)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

71.74 (calculated-P/C, Burkhard 1984)

21.18 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

31.89 (calculated-QSPR, Dunnivant et al. 1992)

68.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 47 \pm 8$ kJ/mol, $\Delta S_H = 0.13 \pm 0.03$ kJ/mol·K (Bamford et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.66 (calculated-TSA, Burkhard 1984)

6.51 (calculated-TSA, Hawker & Connell 1988)

6.94, 6.75; 6.56, 6.41 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

6.85 (recommended, Sangster 1993)

6.97 (recommended, Hansch et al. 1995)

6.5729 (calculated-molecular properties MNDO-AMI method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.84 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.46 (suspended particulate matter, Burkhard 1984)
5.119 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constant and Half-Lives:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16-0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60 \text{ d}$ at room temp. (Kwok et al. 1995)

7.73×10^{-4} , 9.614×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

1.87×10^{-4} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

6.31×10^{-4} , 8.51×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4816/(T/K) + 13.04$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

18.54 (calculated-P/C, Burkhard 1984)

8.92 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

25.23 (calculated-QSAR- MCI χ , Sabljic & Güsten 1989)

2.53 (wetted wall column-GC/ECD, Brunner et al. 1990; quoted, Achman et al. 1993)

19.0 (calculated-QSPR, Dunnivant et al. 1992)

17.8 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

60.7 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 59 \pm 7$ kJ/mol, $\Delta S_H = 0.17 \pm 0.02$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.74 (calculated-TSA, Burkhard 1984)

6.85 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

6.89 (calculated-TSA, Hawker & Connell 1988a)

- 7.02, 7.08; 6.71, 6.71 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)
 6.57 (generator column-GC, Larsen et al. 1992)
 6.85 (recommended, Sangster 1993)
 7.12 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 10.96, 9.84 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
 9.97 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Partition Coefficient between particulate and dissolved contaminant concentrations, $\log K_p$ or $\log K_d$

- 5.80, 5.30 (Lake Superior suspended solids, concn ratio-GC/ECD, Baker et al. 1986)
 5.40 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.54 (suspended particulate matter, Burkhard 1984)
 5.40 (Lake Superior suspended solids, GC/ECD, Baker et al. 1986)
 5.18, 5.22, 5.14, 4.58 (marine humic substances, in concentrations of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
 5.18; 5.22 (marine humic substances with 5 mg/L DOC, reported as association coefficient $\log K_h$, observed; calculated-MCI $^1\chi$, Sabljic et al. 1989)
 5.87 (Ispra soil, shake flask-GC, Paya-Perez et al. 1991)
 6.20 (colloids and micro-particulates from precipitation events, Murray & Andren 1992)
 6.20 (soil-organic carbon, calculated- K_{OW} , Girvin & Scott 1997)
 6.01 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 166 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 216 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 166 \text{ d}$ for high-dose treatment, $t_{1/2} = 216 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.147 2,2',3,4',5,6-Hexachlorobiphenyl (PCB-147)

Common Name: 2,2',3,4',5,6-Hexachlorobiphenyl

Synonym: PCB-147, 2,2',3,4',5,6-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4',5,6-hexachlorobiphenyl

CAS Registry No: 68194-13-8

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

116 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0134 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00287 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

2.86×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00309 (GC-RI correlation, Burkhard et al. 1985b)

$\log(P/mmHg) = 11.20 - 4910/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

77.21 (calculated-P/C, Burkhard 1984)

32.63 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

5.17 (wetted wall column-GC/ECD, Brunner et al. 1990)

31.97 (calculated-QSPR, Dunnivant et al. 1992)

5.70 (calculated-QSPR, Achman et al. 1993)

68.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 47 \pm 8\ kJ/mol$, $\Delta S_H = 0.13 \pm 0.02\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.77 (calculated-TSA, Burkhard 1984)

6.64 (calculated-TSA, Hawker & Connell 1988a)

7.07, 6.73, 6.52, 6.51 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

6.52, 6.90 (quoted average values of Risby et al. 1990, Sangster 1993)

6.93 (recommended, Hansch et al. 1995)

6.6069 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated:

10.79, 9.672 (0, $20^{\circ}C$, multi-column GC- k' correlation, Zhang et al. 1999)

9.70 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

- 6.57 (suspended particulate matter, Burkhard 1984)
5.083 (marine humic substances 5 mg/L of DOC, reported as association coefficient log K_h , calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

0.00907 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$):

4.07×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00438 (GC-RI correlation, Burkhard et al. 1985b)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

121.6 (calculated-P/C, Burkhard 1984)

52.18 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

51.25 (calculated-QSPR, Dunnivant et al. 1992)

81.5 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 27 \pm 5$ kJ/mol, $\Delta S_H = 0.06 \pm 0.02$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.81 (calculated-TSA, Burkhard 1984)

6.32 (calculated-TSA, Hawker & Connell 1988a)

6.69; 6.59; 6.34, 6.27 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

6.64, 6.31 (quoted average values of Risby et al. 1990, Sangster 1993)

6.75 (recommended, Hansch et al. 1995)

6.1643 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.65 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.61 (suspended particulate matter, Burkhard 1984)
4.924 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.151 2,2',3,5,5',6-Hexachlorobiphenyl (PCB-151)

Common Name: 2,2',3,5,5',6-Hexachlorobiphenyl

Synonym: PCB-151, 2,2',3,5,5',6-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,5,5',6-hexachlorobiphenyl

CAS Registry No: 52663-63-5

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

101 (Burkhard et al. 1985b)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

237.4 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.180 (mp at $101^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.0134 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.01355 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.00454, 0.00414, 0.00487, 0.00337 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.00720 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.00223 (calculated-QSPR, Dunnivant et al. 1992)

0.00203 (calculated-group contribution method, Kühne et al. 1995)

0.00173, 0.00454 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

0.00559 (calculated-mp and K_{ow} , Ran et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

3.32×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

1.16×10^{-3} , 1.67×10^{-4} , 2.23×10^{-4} (calculated-MW, GC-RI correlation, MCI χ , Burkhard et al. 1985b)

0.00177, 0.00255 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

5.97×10^{-4} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

$\log(P/mmHg) = 11.30 - 4910/(T/K)$ (GC-RT correlation, Tateya et al. 1988)

1.91×10^{-3} (supercooled liquid P_L : GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4681/(T/K) + 12.95$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

86.94 (calculated-P/C, Burkhard 1984)

15.91 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

52.18 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

5.98 (wetted wall column-GC/ECD, Brunner et al. 1990)

28.69 (calculated-QSPR, Dunnivant et al. 1992)

33.4 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

73.5 (from 11°C exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 37 \pm 5$ kJ/mol, $\Delta S_H = 0.10 \pm 0.02$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.76 (calculated-TSA, Burkhard 1984)

6.38, 6.49, 6.32, 6.51 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

6.64 (calculated-TSA, Hawker & Connell 1988a)

6.95, 7.35; 6.44, 6.43 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

6.45 (generator column-GC, Larsen et al. 1992)

6.43 (recommended, Sangster 1993)

6.85 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

10.08 (10°C, estimated, Thomas et al. 1998)

10.68, 9.58 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)

9.68 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

5.54; 7.07 (zebrafish: $\log BCF_W$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)

Sorption Partition Coefficient, $\log K_{OC}$:

6.56 (suspended particulate matter, Burkhard 1984)

5.03, 5.11, 5.09, 4.41 (marine humic substances, in concentrations of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)

5.031; 5.083 (marine humic substances with 5 mg/L DOC, reported as association coefficient $\log K_h$, observed; calculated-MCI χ , Sabljic et al. 1989)

6.05, 6.05, 5.93 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)

5.79 (Ispra soil, shake flask-GC, Paya-Perez et al. 1991)

4.99, 4.82; 4.85 (sediments from Brown's Lake, Helmet City Lake; WES reference soil, shake flask-HPLC/fluorescence, Brannon et al. 1995)

6.20 (soil-organic carbon, calculated- K_{OW} , Girvin & Scott 1997)

5.75 (4.96–6.18) (sediment: organic carbon OC $\geq 0.5\%$, average, Delle Site 2001)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29\text{--}60$ d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 4220$ d⁻¹; $k_2 = 0.0121$ d⁻¹ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.004$ d⁻¹ with $t_{1/2} = 174$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004$ d⁻¹ with $t_{1/2} = 196$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 174$ d for high-dose treatment, $t_{1/2} = 196$ d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.152 2,2',3,5,6,6'-Hexachlorobiphenyl (PCB-152)

Common Name: 2,2',3,5,6,6'-Hexachlorobiphenyl

Synonym: PCB-152, 2,2',3,5,6,6'-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',3,5,6,6'-hexachlorobiphenyl

CAS Registry No: 68914-09-2

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

- $52.8^* \pm 1.6$ (gas stripping-GC, measured range 4–31°C, Bamford et al. 2000)
- $\ln K_{AW} = 22.853 - 7950.45/(T/K)$; temp range 4–31°C (gas stripping-GC, Bamford et al. 2000)
- $K_{AW} = \exp\{-[66.1/(\text{kJ mol}^{-1})]/RT\} + [0.190/(\text{kJ mol}^{-1} \text{K}^{-1})/R]$; where $R = 8.314 \text{ J K}^{-1} \text{ mol}^{-1}$ and temp range: 4–31°C, (gas stripping-GC, Bamford et al. 2000)
- 54.0 (exptl. data, Bamford et al. 2002)
- $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 66 \pm 5 \text{ kJ/mol}$, $\Delta S_H = 0.19 \pm 0.02 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004
- 6.94 (estimated-bond method EPIWIN v3.04, Hardy 2002)
- 25.12, 19.95 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)
- $\log H/(\text{Pa m}^3/\text{mol}) = -2584/(T/K) + 10.07$ (LDV linear regression of literature data, Li et al. 2003)
- $\log H/(\text{Pa m}^3/\text{mol}) = -3407/(T/K) + 12.72$ (FAV final adjusted eq., Li et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 6.72 (shake flask-GC/ECD, Chiou et al. 1977; Freed et al. 1977; Chiou et al. 1982)
- 8.35 (Hansch & Leo 1979)

- 6.34 (shake flask-GC/ECD, Karickhoff et al. 1979)
- 7.44 (RP-TLC- k' correlation, Bruggeman et al. 1982; 1984)
- 6.93, 7.75 (RP-HPLC-RT correlation, uncorrected, with ortho correction, Rapaport & Eisenreich 1984)
- 6.90 (generator column-HPLC, Woodburn et al. 1984)
- 6.68 (HPLC/MS correlation, Burkhard et al. 1985c)
- 7.69, 7.71 (HPLC- k' correlation, calculated, De Kock & Lord 1987)
- 6.90 (generator column-GC/ECD, Doucette & Andren 1987, 1988)
- 7.69 (HPLC-RT correlation, De Kock & Lord 1987)
- 7.24 (calculated-UNIFAC activity coefficients, Banerjee & Howard 1988)
- 6.84, 6.90, 6.71, 6.74 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 6.82, 6.85 (RP-HPLC- k' correlation, different stationary phases, Sherbolm & Eganhouse 1988)
- 7.00 (RP-HPLC-RT correlation, Watanabe & Tatsukawa 1989)
- 7.07, 7.12; 6.75, 6.72 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)
- 6.81 (HPLC- k' correlation, Noegrohati & Hammers 1992)
- 6.51 (average, generator column-GC, Larsen et al. 1992)
- 6.80 (recommended, Sangster 1993)
- 7.50 (recommended, Hansch et al. 1995)
- 6.58 (shake flask/slow stirring-GC/ECD, both phases, Fisk et al. 1999)
- 6.71, 6.87 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

- 8.50 (calculated- K_{OW}/K_{AW} , Wania & Mackay 1996)
- 10.04* (20°C, generator column-GC, measured range -10 to 30°C, Harner & Bidleman 1996)
- $\log K_{OA} = -6.02 + 4696/(T/K)$; temp range -10 to +30°C (generator column-GC, Harner & Bidleman 1996)
- 9.37; 9.09 (fugacity meter/generator column-GC; measured range 10–43°C, calculated, Kömp & McLachlan 1997a)
- $\log K_{OA} = -5.49 + 4430/(T/K)$; temp range 10–43°C (fugacity meter, Kömp & McLachlan 1997a)
- 10.50 (10°C, estimated, Thomas et al. 1998)
- 11.03, 9.99; 10.02 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
- 10.08 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)
- 9.80; 9.65 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)
- 9.52, 9.44 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)
- $\log K_{OA} = 4966/(T/K) - 7.14$ (LDV linear regression of literature data, Li et al. 2003)
- $\log K_{OA} = 3785/(T/K) - 7.00$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, $\log BCF$ at 25°C or as indicated:

- 4.68 (oyster, Vreeland 1974)
- 4.66 (fish, flowing water, Kenaga & Goring 1980; Kenaga 1980)
- 4.48, 5.23 (calculated-S, K_{OC} , Kenaga 1980)
- 5.23, 3.76 (amphipods, clams, Lynch et al. 1982)
- 5.03, 4.88, 4.65 (algae, snail, aquatic earthworm, Lynch et al. 1982)
- 4.82, 4.63 (crayfish, fish, Lynch et al. 1982)
- 4.00, 4.72, 3.77 (calculated-S, calculated-C, calculated- K_{OW} , Lynch et al. 1982)
- 0.99 (poultry, Garten & Trabalka 1983)
- 6.78 (guppy, 3.5% lipid, Bruggeman et al. 1982, 1984)
- 4.84 (rainbow trout, ratio of uptake and depuration rate constants, Muir et al. 1985)
- 5.87; 6.00 (rainbow trout: laboratory studies; Lake Ontario field data, Oliver & Niimi 1985)
- 2.60, 2.48 (human fat of lipid, wet wt. basis, calculated- K_{OW} , Geyer et al. 1987)
- 5.32 (guppy, Gobas et al. 1987)
- 4.57 (*Selenastrum capricornutum*, Mailhot 1987)
- 4.48 (worms, Oliver 1987c)
- 4.84, 5.32 (fish, calculated- C_B/C_W or k_1/k_2 , Connell & Hawker 1988; Hawker 1990)

- 3.85 (*Hexagenia limbata*, 4°C, rate const. ratio: uptake and depuration k_1/k_2 , Landrum & Poore 1988)
 4.94–5.28 (*Hexagenia limbata*, May–November, calculated-lipid-normalized, Landrum & Poore 1988)
 5.01 (*Pontoporeia hoyi*, calculated, Evans & Landrum 1989)
 5.06 (guppy, estimated, Banerjee & Baughman 1991)
 5.65; 7.18 (22°C, zebrafish: log BCF_w wet wt basis; log BCF_L lipid wt basis, Fox et al. 1994)
 3.31–5.57 (various marine species, mean dry wt. BCF, Hope et al. 1998)
 5.11–6.96 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)
 5.32 (Baltic Sea blue mussels, flow-through exptl, dry wt., Gustafsson et al. 1999)
 4.68, 5.93 (oyster: wet wt basis, lipid wt basis, Geyer et al. 2000)
 5.48, 7.40 (mussel: wet wt basis, lipid wt basis, Geyer et al. 2000)
 5.63, 6.99 (guppy: wet wt basis, lipid wt basis, Geyer et al. 2000)
 5.65, 7.19 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)
 3.95; 3.95 (*Oncorhynchus mykiss*, wet wt. basis: quoted exptl.; calculated-QSAR model based on quantum chemical parameters, Wei et al. 2001)
 4.40 (estimated-EPIWIN v3.04, Hardy 2002)

Sorption Partition Coefficient, log K_p:

- 3.95–4.17 (Saginaw Bay sediment, sorption isotherm, Horzempa & Di Toro 1983)
 4.12–4.55 (Saginaw Bay suspended solids, sorption isotherm, Horzempa & Di Toro 1983)
 5.30 (Lake Superior suspended solids, field measurement-GC/ECD, Baker et al. 1986)
 5.60 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
 5.65–5.91 (field-generated particulates, New Bedford Harbor, Bergen et al. 1993)

Sorption Partition Coefficient, log K_{OC} at 25°C or as indicated:

- 5.62 (soil/sediment, batch equilibrium-sorption isotherm, Haque & Schmedding 1976)
 5.34 (soil, batch equilibrium-sorption isotherm measurement, Chiou et al. 1979)
 6.51 (soil, calculated-K_{OW}, Karickhoff et al. 1979)
 6.08 (soil, quoted experimental value, Kenaga 1980)
 5.33 (calculated-K_{OW}, Schwarzenbach & Westall 1981)
 6.51 (calculated-K_{OW}, Schwarzenbach & Westall 1981 from Karickhoff 1981)
 6.43, 6.42, 5.33 (calculated-K_{OW}, calculated-C_L, calculated-C_S, Karickhoff 1981)
 6.51 (sediment, calculated-K_{OW}, Lynch et al. 1982)
 6.57 (suspended particulate matter, calculated-K_{OW}, Burkhard 1984)
 5.60; 5.50; 7.30 (field data of sediment trap material; Niagara River-org. matter; calculated-K_{OW}, Oliver & Charlton 1984)
 6.61 (sediment/pore water-Saginaw Bay, dual radio-tag experiment, Di Toro et al. 1985)
 5.51 (Aldrich humic acid, reversed phase separation, Landrum et al. 1985)
 5.40, 5.70, 6.10 (Offshore Grand Haven sediment, nearshore Grand Haven sediment, Benton Harbor sediment, by batch equilibrium-sorption isotherm, Voice & Weber 1985)
 7.56, 7.68 (river sediment, Coates & Elzerman 1986)
 5.575 (correlated literature values in soils, Sklarew & Girvin 1987)
 5.8–7.3, 6.60; 7.20 (suspended sediment, average; algae > 50 µm, Oliver 1987a)
 6.60 (river sediment 7–13% OC, batch equilibrium, Oliver 1987)
 6.48 (Lake Michigan water column, Swackhamer & Armstrong 1987)
 4.75 (12 lakes/streams in southern Ontario at 1.6–26.5 mg/L DOC, Evans 1988)
 5.26, 5.25, 5.19, 4.62 (humic substances, in concentration of 5, 10, 20, 40 mg/L DOC, reported as log K_h, Lara & Ernst 1989)
 5.258, 5.222 (marine humic substances, calculated-MCI χ , reported as log K_h at concentration of 5 mg/L DOC, Sabljic et al. 1989)
 6.76, 4.42 (Great Lake suspended matter, Great Lake DOC: reversed phase separation, Eadie et al. 1990)
 6.18, 6.13, 5.99 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)
 5.86 (Ispra soil, shake flask-GC, Paya-Perez et al. 1991; quoted, Baker et al. 2000)
 6.40 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
 5.54 (Red Hood sediment, batch equilibrium, Brannon et al. 1995)

- 5.65 (soil, calculated-MCI χ , Sabljic et al. 1995)
 6.02 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)
 6.42–6.48 (Catlin silt loam, $f_{OC} = 0.0226$, depth 0–15 cm, batch equilibrium-GC, Girvin & Scott 1997)
 6.77–6.84 (Cloudland loam, $f_{OC} = 0.0024$, depth 15–30 cm, batch equilibrium-GC, Girvin & Scott 1997)
 6.43–6.52 (Kenoma silt loam, $f_{OC} = 0.0153$, depth 0–20 cm, batch equilibrium-GC, Girvin & Scott 1997)
 6.51–6.57 (Kenoma silt loam, $f_{OC} = 0.0092$, depth 58–82 cm, batch equilibrium-GC, Girvin & Scott 1997)
 6.19–6.28 (Norborne silt loam, $f_{OC} = 0.0137$, depth 0–20 cm, batch equilibrium-GC, Girvin & Scott 1997)
 6.55 (Norborne silt loam, $f_{OC} = 0.009$, depth 33–65 cm, batch equilibrium-GC, Girvin & Scott 1997)
 6.41–6.59 (Norborne silt loam, $f_{OC} = 0.0057$, depth 65–85 cm, batch equilibrium-GC, Girvin & Scott 1997)
 6.40 (soil, calculated- K_{OW} , Girvin & Scott 1997)
 6.20; 5.60 (soil, calculated-universal solvation model; quoted lit., Winget et al. 2000)
 5.86, 5.81 (sediments: organic carbon OC –0.1%, OC –0.5%, average, Delle Site 2001)
 6.05–7.27; 5.30–7.60 (range, calculated from sequential desorption of 11 urban soils; lit. range, Krauss & Wilcke 2001)
 5.55; 6.17, 6.96, 6.50 (20°C, batch equilibrium, A2 alluvial grassland soil; calculated values of expt 1,2,3-solvophobic approach, Krauss & Wilcke 2001)
 5.088 (estimated-EPIWIN v3.04, Hardy 2002)
 6.20–7.20 (field contaminated sediment, initial-final values for 2–1461 d contact time, gas-purge technique-GC/ECD, ten Hulscher et al. 2003)

Sorption Partition Coefficient, log K_{OM} :

- 4.42 (natural sediment, Eadie et al. 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: depletion rate constant $k = 17 \text{ d}^{-1}$ from a 26-cm or 67-cm high purge vessel (Girvin et al. 1997);
 $t_{1/2} = 2.096 \text{ d}$ from river, $t_{1/2} = 29.5 \text{ d}$ from lake (estimated-EPIWIN v3.04, Hardy 2002).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.16\text{--}0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29\text{--}60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_1 = 29.5 \text{ d}^{-1}$ in pond, $k_1 = 14.6 \text{ d}^{-1}$ in river, $k_1 = 36.8 \text{ d}^{-1}$ in sand by *Chironomus tentans* larvae (Muir et al. 1983)
 $k_2 = 0.0029 \text{ d}^{-1}$ with elimination $t_{1/2} = 241 \text{ h}$ in pond-sediment, $k_2 = 0.0059 \text{ d}^{-1}$ with $t_{1/2} = 117 \text{ h}$ in river water, $k_2 = 0.0034 \text{ d}^{-1}$ with $t_{1/2} = 203 \text{ h}$ in river sediment and $k_2 = 0.0030 \text{ d}^{-1}$ with $t_{1/2} = 230 \text{ h}$ in sand-sediment by *Chironomus tentans* larvae (Muir et al. 1983)
 $k_2 > 0.0007 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)
 $k_1 = 800 \text{ d}^{-1}$; $k_2 = 0.004 \text{ d}^{-1}$ (guppy, Bruggeman et al. 1984)
 $k_1 = 461 \text{ d}^{-1}$; $k_2 = 0.008 \text{ d}^{-1}$ (rainbow trout, total ^{14}C in whole fish-wet weight, Muir et al. 1985)
 $k_1 = 1100 \text{ d}^{-1}$ (guppy, Opperhuizen 1986)
 $k_1 = 63.2 \text{ h}^{-1}$; $k_2 = 0.009 \text{ h}^{-1}$ (10–20°C, *Hexagenia limbata*, Landrum & Poore 1988)
 $k_s = 0.049 \text{ h}^{-1}$; $k_t = 0.009 \text{ h}^{-1}$ (uptake, depuration of mayfly-sediment model II, Gobas et al. 1989)
 $\log k_1 = 2.90, 2.66 \text{ d}^{-1}$; $\log 1/k_2 = 2.39, 2.10 \text{ d}$ (fish, quoted, Connell & Hawker 1990)
 $k_1 = 4660 \text{ d}^{-1}$; $k_2 = 0.0104 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)
 $k_2 = 0.044 \text{ d}^{-1}$ with an elimination half-life of 15.9 d (earthworm, Belfroid et al. 1995)
 $k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 224 \text{ d}$ and $k_2 = 0.010 \text{ d}^{-1}$ with $t_{1/2} = 69 \text{ d}$ for food concn of 22 ng/g and 124 ng/g, respectively, in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)
 $k_1 = 5.7 \text{ L d}^{-1} \text{ g}^{-1}$; $k_2 = 0.027 \text{ d}^{-1}$ (Baltic Sea blue mussels, flow-through expt., Gustafsson et al. 1999)
 $k_1 = 0.00231 \text{ h}^{-1}$; $k_2 = 0.137 \text{ h}^{-1}$ (in blood plasma of ring doves, Drouillard & Norstrom 2000)

$k_1 = 5$ (food lipid mg)/(g worm lipid-d); $k_2 = 0.04$ d⁻¹ (earthworm, Wågman et al. 2001)
 $k_2 = 0.004$ d⁻¹ with $t_{1/2} = 177$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.003$ d⁻¹ with $t_{1/2} = 219$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)
 $k_2 = 0.015$ d⁻¹ with $t_{1/2} = 46.2$ d (juvenile carp in 100-d experiment Stapleton et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radical for hexachlorobiphenyls (Kwok et al. 1995);

$t_{1/2} = 6000$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: 25–53 min in aqueous solution purged at a flow rate of 1 L/min (Coates 1984);

$t_{1/2} = 123000$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000); volatilization $t_{1/2} = 2.096$ d from river, 29.5 d from lake (estimated-EPIWIN v3.04, Hardy 2002).

Groundwater:

Sediment: uptake clearance from sediment was (0.0021 ± 0.001) g of dry sediment·g⁻¹ of organism·h⁻¹ for amphipod, *P. hoyi* in Lake Michigan sediments at 4°C (Landrum 1989);

$k(\text{exptl}) < 0.9$ M⁻¹ s⁻¹ for direct reaction with ozone in water at pH 2.7–6.3, with $t_{1/2} > 7$ h at pH 7 and 23 ± 2 °C (Yao & Haag 1991).

$t_{1/2} = 165000$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: $t_{1/2} = 165000$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: half-life in rainbow trout, > 1000 d and its muscle, 77 d (Niimi & Oliver 1983);

$t_{1/2} = 170$ d in worms at 8°C (Oliver 1987c);

$t_{1/2} = 175$ d in guppy (Bruggeman et al. 1984);

$t_{1/2} = 45.6$ d in *Pontoporeia hoyi* (Evans & Landrum 1989);

elimination $t_{1/2} = 15.9$ d from earthworm (Belfroid et al. 1995)

Depuration $t_{1/2} = 69$ –224 d in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

theoretical $t_{1/2} = 25.7$ d to reach 90% steady-state tissue concn (Baltic Sea blue mussels, flow-through expt., Gustafsson et al. 1999);

$t_{1/2} = 5.1$ h in blood plasma (ring doves, Drouillard & Norstrom 2000);

elimination $t_{1/2} = 18$ d in earthworm given contaminated food (Wågman et al. 2001).

depuration $t_{1/2} = 177$ d for high-dose treatment, $t_{1/2} = 219$ d for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

depuration $t_{1/2} = 46.2$ d (juvenile carp in 100-d experiment Stapleton et al. 2004)

TABLE 7.1.1.153.1

Reported aqueous solubilities, Henry's law constants and octanol-air partition coefficients of 2,2',4,4',5,5'-hexachlorobiphenyl (PCB-153) at various temperatures and the reported empirical temperature dependence equations

Aqueous solubility		Henry's law constant		log K_{OA}	
Doucette & Andren 1988		Bamford et al. 2000		Harner & Bidleman 1996	
generator column-GC/ECD		gas stripping-GC/MS		generator column-GC	
t/°C	S/g·m ⁻³	t/°C	H/(Pa·m ³ /mol)	t/°C	log K_{OA}
4	0.00462	4	6.50	-10	11.73
25	0.00845	11	13.52	0	11.25
40	0.0128	18	27.2	10	10.62
		25	52.8	20	10.04
		31	91.2	30	9.39
$S/(\text{mol/L}) = A \cdot \exp[B \cdot (t/^\circ\text{C})]$		$\ln K_{AW} = -\Delta H/RT + \Delta S/R$		$\Delta H_{OA}/(\text{kJ mol}^{-1}) = 89.90$	
A	1.15×10^{-8}	A	22.8530	$\log K_{OA} = A + B/T$	
B	0.028	B	7950.45	A	-6.015
$\Delta H_{sol}/(\text{kJ mol}^{-1}) = 20.3$		enthalpy, entropy change:		B	4695
for 4–40°C		$\Delta H/(\text{kJ mol}^{-1}) = 66.1 \pm 5.4$			
		$\Delta S/(\text{J mol}^{-1} \cdot \text{K}^{-1}) = 190 \pm 18$			

FIGURE 7.1.1.153.1 Logarithm of mole fraction solubility, Henry's law constant and K_{OA} versus reciprocal temperature for 2,2',4,4',5,5'-hexachlorobiphenyl (PCB-153).

7.1.1.154 2,2',4,4',5,6'-Hexachlorobiphenyl (PCB-154)

Common Name: 2,2',4,4',5,6'-Hexachlorobiphenyl

Synonym: PCB-154, 2,2',4,4',5,6'-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',4,4',5,6'-hexachlorobiphenyl

CAS Registry No: 60145-22-4

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

oil (Erickson 1986)

117 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0106 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00173, 0.00137, 0.00293, 0.00213 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.00181 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.71×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

1.86×10^{-3} (GC-RI correlation, Burkhard et al. 1985b)

0.00182 (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4681/(T/K) + 12.94$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

58.46 (calculated-P/C, Burkhard 1984)

48.84 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

38.7 (calculated-QSPR, Dunnivant et al. 1992)

17.34, 29.16, 47.85, 76.7 \pm 2.2, 113.7 (4, 11, 18, 25, $31^{\circ}C$, gas stripping-GC, Bamford et al. 2000)

$\ln K_{AW} = 15.155 - 5556.89/(T/K)$; temp range $4-31^{\circ}C$ (gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(46.2/kJ \cdot mol^{-1})/RT] + (0.126/kJ \cdot mol^{-1} \cdot K^{-1})/R$; where $R = 8.314\ J \cdot K^{-1} \cdot mol^{-1}$ and temp range: $4-31^{\circ}C$, (gas stripping-GC, Bamford et al. 2000)

75.4 (exptl. data, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 46 \pm 5\ kJ/mol$, $\Delta S_H = 0.13 \pm 0.02\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.87 (calculated-TSA, Burkhard 1984)

6.67, 6.81, 6.47, 6.64 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

6.76 (calculated-TSA, Hawker & Connell 1988a)

7.05, 7.03; 6.48, 6.43 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

- 6.65 (recommended, Sangster 1993)
6.89 (recommended, Hansch et al. 1995)
6.6326 (molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 9.91 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.66 (suspended particulate matter, Burkhard 1984)
5.064 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16-0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.155 2,2',4,4',6,6'-Hexachlorobiphenyl (PCB-155)

Common Name: 2,2',4,4',6,6'-Hexachlorobiphenyl

Synonym: PCB-155, 2,2',4,4',6,6'-hexachloro-1,1'-biphenyl

Chemical Name: 2,2',4,4',6,6'-hexachlorobiphenyl

CAS Registry No: 33979-03-2

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

112.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.3482

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

237.4 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.5 (differential scanning calorimetry, Miller et al. 1984; Ruelle et al. 1993; Chickos et al. 1999)

20.30 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

45.19 (Miller et al. 1984)

45.25, 66.9 (exptl., calculated, Chickos et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.139 (mp at $112.5^{\circ}C$)

0.131 (Mackay et al. 1980; Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.00090 (generator column-GC/ECD, Weil et al. 1974)

0.00041 (generator column-GC/ECD, Miller et al. 1984,1985)

0.0000528 (calculated-UNIFAC activity coefficients, Banerjee & Howard 1988)

2.50×10^{-3} , 1.34×10^{-3} , 6.27×10^{-3} , 2.68×10^{-3} (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.0023 (generator column-GC/ECD, Dunnivant & Elzerman 1988)

0.00109 ($22^{\circ}C$, generator column-GC/ECD, Opperhuizen et al. 1988)

0.0033 (generator column-GC/ECD, Li et al. 1992; Li & Doucette 1993)

0.00284 (shake flask-GC/ECD, Li & Andren 1994)

$0.0028^* \pm 0.00013$ (generator column-GC/ECD, Shiu et al. 1997)

1.89×10^{-3} , 0.0050 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

$\ln x = -8.9206 - 4112.07/(T/K)$, temp range $5-50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

0.0142, 0.0138 (supercooled liquid S_L : derivation of literature-derived value LDV, final-adjusted value FAV, Li et al. 2003)

$\log [S_L/(mol\ m^{-3})] = -861/(T/K) - 1.52$ (supercooled liquid, linear regression of literature data, Li et al. 2003)

$\log [S_L/(mol\ m^{-3})] = -1268/(T/K) - 0.16$ (supercooled liquid, final adjusted eq., Li et al. 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0016 (GC-RT, Westcott et al. 1981)

0.0122 (P_L calculated from P_s using fugacity ratio F, Westcott et al. 1981)

0.00173 (gas saturation, Westcott & Bidleman 1981)

0.00443 (supercooled liquid P_L , Burkhard 1984)

3.57×10^{-4} , 6.41×10^{-4} , 8.04×10^{-4} (calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985a)
 0.00443 (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)
 0.00159, 0.012(selected P_S , P_L , Shiu & Mackay 1986)
 4.76×10^{-4} (calculated-S \times HLC, Dunnivant & Elzerman 1988)
 3.54×10^{-4} (supercooled liquid P_L , calculated-mp, Dunnivant & Elzerman 1988)
 $\log(P_L/P_a) = -4303/(T/K) + 12.02$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)
 3.25×10^{-4} * (gas saturation-GC/ECD, measured range -10 to 30°C , Wania et al. 1994)
 $\log(P_S/P_a) = 14.84 - 5399/(T/K)$; temp range -10 to 30°C (gas saturation-GC, Wania et al. 1994)
 2.188×10^{-3} (20°C , supercooled liquid P_L from Falconer & Bidleman 1994, Harner & Bidleman 1996)
 0.000285–0.0016; 0.00344–0.00443 (exptl. solid P_S range; exptl. liquid P_L range, Delle Site 1997)
 3.42×10^{-4} (supercooled P_L : calculated-MCI χ and Characteristic Root Index CRI, Saçan & Balcioglu 1998)
 3.31×10^{-3} ; 3.47×10^{-3} (supercooled P_L : LDV literature derived value, FAV final adjusted value, Li et al. 2003)
 $\log P_L/P_a = -4697/(T/K) + 13.27$ (supercooled liquid, LDV linear regression of literature data, Li et al. 2003)
 $\log P_L/P_a = -4562/(T/K) + 12.85$ (supercooled liquid, FAV final adjusted eq., Li et al. 2003)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

11.65 (gas stripping-GC, Coates 1984)
 157.0 (calculated-P/C, Burkhard et al. 1985b)
 12.46 (calculated, Coates & Elzerman 1986)
 817.9 (calculated-P/C, Shiu & Mackay 1986)
 76.5 (gas stripping-GC, Dunnivant et al. 1988, Dunnivant & Elzerman 1988)
 60.8 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)
 85.25 (calculated-QSPR, Dunnivant et al. 1992)
 81.5 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 27 \pm 5 \text{ kJ/mol}$, $\Delta S_H = 0.06 \pm 0.02 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004
 75.86, 91.2 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)
 $\log[H/(\text{Pa m}^3/\text{mol})] = -3294/(T/K) + 13.01$ (FAV final adjusted eq., Li et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.70 (shake flask-GC, Chiou et al. 1977)
 6.34 (shake flask-GC, Karickhoff et al. 1979)
 6.37 (HPLC- k' correlation, McDuffie 1981)
 7.12 (RP-TLC- k' correlation, Bruggeman et al. 1982)
 6.88 (calculated-TSA, Burkhard 1984)
 7.55 (generator column-GC/ECD, Miller et al. 1984, 1985)
 6.39 (HPLC-RT/MS correlation, Burkhard et al. 1985c)
 6.01 (HPLC- k' correlation, Tomlinson & Hafkenscheid 1986)
 7.24 (calculated-UNIFAC activity coeff., Banerjee & Howard 1988)
 6.54, 6.81, 6.24, 6.57 (RP-HPLC-RI correlations, Brodsky & Ballschmiter 1988)
 7.24 (calculated-UNIFAC activity coefficients, Banerjee & Howard 1988)
 7.287 ± 0.065 (slow stirring-GC, De Bruijn et al. 1989; De Bruijn & Hermens 1990)

 6.83 (HPLC- k' correlation, Noegrohati & Hammers 1992)
 7.24 (shake flask-GC/ECD, Li & Doucette 1993)
 6.54 (recommended, Sangster 1993)
 7.29 (recommended, Hansch et al. 1995)
 7.36, 7.19 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

8.99* (generator column-GC/ECD; measured range -10 to $+20^\circ\text{C}$; Harner & Mackay 1995)
 $\log K_{OA} = -2.20 + 3954/(T/K)$; (temp range -10 to $+20^\circ\text{C}$, generator column-GC, Harner & Mackay 1995)

- 9.15 (20°C, generator column-GC, Harner & Bidleman 1996)
 $\log K_{OA} = -2.21 + 3954/(T/K)$; temp range -10 to +20°C (generator column-GC, Harner & Bidleman 1996)
 10.19, 9.13; 9.16 (0, 20°C, multi-column GC-k' correlation; calculated at 20°C, Zhang et al. 1999)
 9.24 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)
 8.89, 9.14 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)
 $\log K_{OA} = 4357/(T/K) - 5.47$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, log BCF at 25°C or as indicated:

- 1.02 (poultry, Garten & Trabalka 1983)
 2.79–3.68 highest value 3.68, not equilibrated (rainbow trout, 15°C, steady-state BCF of 7-d to 96-d laboratory study, Oliver & Niimi 1985)
 > 4.94; 3.68 (rainbow trout, laboratory data: kinetic BCF (k_1/k_2), steady-state BCF (C_F/C_W), Oliver & Niimi 1985)
 4.53 (worms, Oliver 1987c)
 3.68 (fish, Isnard & Lambert 1988)
 5.99, 7.29 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, log K_{OC} :

- 6.08 (natural sediment, sorption isotherm by batch equilibrium technique-GC, Karickhoff et al. 1979)
 5.95, 7.28, 5.95 (calculated- K_{OW} , calculated- C_L , calculated- C_S , Karickhoff 1981)
 6.68 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 4.905 (calculated-MCI χ , marine humic substances with 5 mg/L of DOC, reported as association coefficient log K_h , Sabljic et al. 1989)
 6.08; 6.17 (soil, quoted lit.; calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_1 = 8.6-29.5 \text{ h}^{-1}$ in pond-sediment system, $k_1 = 22.9-14.6 \text{ h}^{-1}$ in river-water system, $k_1 = 29.6-39.8 \text{ h}^{-1}$ in river-sediment system, $k_1 = 26.7-47.0 \text{ h}^{-1}$ in sand-sediment system (*Chironomus tentans* larvae, Muir et al. 1983)
 $k_2 = 0.0029 \text{ h}^{-1}$ with $t_{1/2} = 241 \text{ h}$ in pond-sediment system, $k_2 = 0.0059 \text{ h}^{-1}$ with $t_{1/2} = 117 \text{ h}$ in river-water system, $k_2 = 0.0034 \text{ h}^{-1}$ with $t_{1/2} = 203 \text{ h}$ in river-sediment system, $k_2 = 0.0030 \text{ h}^{-1}$ with $t_{1/2} = 230 \text{ h}$ in sand-sediment system (*Chironomus tentans* larvae, Muir et al. 1983)
 $k_2 > 0.0007 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)
 $k_1 = 60 \text{ d}^{-1}$; $k_2 > 0.0007 \text{ d}^{-1}$ (rainbow trout, Oliver & Niimi 1985; Thomann 1989)
 $\log 1/k_2 = 3.1, 3.6 \text{ h}$ (fish, quoted, calculated- K_{OW} , Hawker & Connell 1988b)
 $1/k_2 = 141 \text{ d}$ (guppy, Gobas et al. 1989; quoted, Clark et al. 1990)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} = 117\text{--}241$ h in sediment-water systems (*Chironomus tentans* larvae, Muir et al. 1983)
 $t_{1/2} > 1000$ d in rainbow trout (Niimi & Oliver 1983; Oliver & Niimi 1985), and $t_{1/2} = 77$ d in its muscle (Niimi & Oliver 1983).

TABLE 7.1.1.155.1

Reported aqueous solubilities and octanol-air partition coefficients log of 2,2',4,4',6,6'-hexachlorobiphenyl (PCB-155) at various temperatures and the reported empirical temperature dependence equations

Aqueous solubility		Vapor pressure		log K_{OA}	
Shiu et al. 1997		Wania et al. 1994		Harner & Mackay 1995	
generator column-GC/ECD		gas saturation-GC		generator column-GC	
t/°C	S/g·m ⁻³	t/°C	P/Pa	t/°C	log K_{OA}
5	1.0×10^{-3}	-10	1.634×10^{-6}	-10	10.49
15	1.70×10^{-3}	0	1.185×10^{-5}	0	9.97

35	4.30×10^{-3}	20	3.250×10^{-4}	20	9.158
45	6.40×10^{-3}	30	7.739×10^{-4}	25	8.99
$\Delta H_{sol}/(\text{kJ mol}^{-1}) = 34.2$ for 5–45°C		log (P/Pa) = A – B/(T/K) A 14.84 B 5399		$\Delta H_{OA}/(\text{kJ mol}^{-1}) = 63.9$ log $K_{OA} = A + B/RT$ A –2.2 B 3337.4	
		$\Delta H_{subl}/(\text{kJ mol}^{-1}) = 103.4$			

FIGURE 7.1.1.155.1 Logarithm of vapor pressure and K_{OA} versus reciprocal temperature for 2,2',4,4',6,6'-hexachlorobiphenyl (PCB-155).

7.1.1.156 2,3,3',4,4',5-Hexachlorobiphenyl (PCB-156)

Common Name: 2,3,3',4,4',5-Hexachlorobiphenyl

Synonym: PCB-156, 2,3,3',4,4',5-hexachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4,4',5-hexachlorobiphenyl

CAS Registry No: 38380-08-4

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

127 (Kühne et al. 1995; Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

237.4 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.100 (mp at $127^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.00533 ($20^{\circ}C$, supercooled liquid S_L , Murphy et al. 1987)

0.00361, 0.00244, 0.00112, 0.00102 (RP-HPLC- k' correlation, different stationary and mobile phases Brodsky & Ballschmiter 1988)

0.000397 (generator column-GC/ECD, Hong & Qiao 1995)

0.0011 (generator column-GC/ECD, measured range $5-35^{\circ}C$, Huang & Hong 2002)—see Comment by van Noort 2004

0.000513, 0.000711, 0.00110, 0.00153 ($5, 15, 25, 35^{\circ}C$, generator column-GC/ECD, Huang & Hong 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.000215 (supercooled liquid P_L , GC-RT correlation, Bidleman 1984)

7.34×10^{-4} (supercooled liquid P_L , GC-RT correlation, Burkhard et al. 1985a)

0.000809 (GC-RI correlation, Burkhard et al. 1985b)

0.00021, 0.00016 (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

1.26×10^{-4} , 1.62×10^{-4} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4949/(T/K) + 12.94$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

88.14 (concn ratio-GC, Murphy & Mullin 1983)

17.53 (calculated-P/C, Burkhard et al. 1985)

2.23 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

8.97 (calculated-QSPR, Dunnivant et al. 1992)

1.50 (calculated-QSPR, Achman et al. 1993)

3.72 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

37.0 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 112 \pm 10$ kJ/mol, $\Delta S_H = 0.34 \pm 0.03$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 7.13, 7.26, 7.84, 7.53 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 7.14, 7.12; 7.16, 7.13 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)
 6.70 (generator column-GC, Larsen et al. 1992)
 7.11 (recommended, Sangster 1993)
 7.57 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 12.07, 10.87; 10.87 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 10.36 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 5.88, 7.18 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.51 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 5.40 (as $\log K_h$, association coefficient with marine humic substance, calculated-MCI χ , Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29\text{--}60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.024 \text{ d}^{-1}$ with an elimination $t_{1/2} = 29 \text{ d}$ (earthworm, Belfroid et al. 1995)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 163 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 182 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota: clearance $t_{1/2} = 50\text{--}100 \text{ d}$ in guppy for hexachlorobiphenyl (Bruggeman et al. 1984);

reported biological half-lives for hexachlorobiphenyls: $t_{1/2} = 87$ to $> 850 \text{ d}$ for trout, $t_{1/2} = 77\text{--}91 \text{ d}$ for trout muscle; $t_{1/2} > 200 \text{ d}$ for carp; $t_{1/2} = 75\text{--}175 \text{ d}$ for guppy (Niimi 1987);

elimination $t_{1/2} = 29 \text{ d}$ from earthworm (Belfroid et al. 1995)

depuration $t_{1/2} = 163 \text{ d}$ for high-dose treatment, $t_{1/2} = 182 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.157 2,3,3',4,4',5'-Hexachlorobiphenyl (PCB-157)

Common Name: 2,3,3',4,4',5'-Hexachlorobiphenyl

Synonym: PCB-157, 2,3,3',4,4',5'-hexachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4,4',5'-hexachlorobiphenyl

CAS Registry No: 69782-90-7

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

141 (estimated-molecular properties, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0152 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00036 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.000119 (generator column-GC/ECD, Hong & Qiao 1995)

0.000296 (generator column-GC/ECD, measured range $5-35^{\circ}C$, Huang & Hong 2002)—see Comment by van Noort 2004

0.000084, 0.000139, 0.000296, 0.000540 ($5, 15, 25, 35^{\circ}C$, generator column-GC/ECD, Huang & Hong 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.39×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

8.09×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

2.02×10^{-4} , 1.27×10^{-4} (supercooled liquid P_L , GC-RT correlation; different stationary phases, Foreman & Bidleman 1985)

1.17×10^{-4} , 1.58×10^{-4} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4994/(T/K) + 13.05$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

3.30 (calculated-P/C, Burkhard et al. 1985a)

58.76 (concn ratio-GC, Murphy & Mullin 1983)

6.69 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

8.56 (calculated-QSPR, Dunnivant et al. 1992)

1.50 (calculated-QSPR, Achman et al. 1993)

2.27 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

31.6 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 129 \pm 10$ kJ/mol, $\Delta S_H = 0.40 \pm 0.03$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.18 (calculated-TSA, Hawker & Connell 1988a)

7.26, 7.14; 7.19, 7.04 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

7.20 (quoted average values of Risby et al. 1990: GC-RV and HPLC- k' correlations, Sangster 1993)

- 7.60 (recommended, Hansch et al. 1995)
 6.9661 (calculated-molecular properties MNDO-AM1, Makino 1998)
 6.73; 6.90 (generator column-GC/ECD, calculated-QSPR, Yeh & Hong 2002)
 7.37, 6.97 (calculated-MCI χ , calculated-MNDO-AMI method, Yeh & Hong 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 12.28, 11.07; 10.76 (0, 20°C, multi-column GC-k' correlation; calculated at 20°C, Zhang et al. 1999)
 10.57 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.51 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 5.40 (as $\log K_h$, association coefficient with marine humic substance, calculated-MCI χ , Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

6.9006 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.05 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.42 (suspended particulate matter, Burkhard 1984)
5.259 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29\text{--}60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.161 2,3,3',4,5',6-Hexachlorobiphenyl (PCB-161)

Common Name: 2,3,3',4,5',6-Hexachlorobiphenyl

Synonym: PCB-161, 2,3,3',4,5',6-hexachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4,5',6-hexachlorobiphenyl

CAS Registry No: 74472-43-8

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

84.0 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0141 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00181 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$):

1.37×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00150 (GC-RI correlation, Burkhard et al. 1985b)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

34.96 (calculated-P/C, Burkhard 1984)

51.27 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

28.89 (calculated-QSPR, Dunnivant et al. 1992)

49.5 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 79 \pm 18$ kJ/mol, $\Delta S_H = 0.23 \pm 0.06$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.76 (calculated-TSA, Burkhard 1984)

7.08 (calculated-TSA, Hawker & Connell 1988a)

7.16, 6.94; 6.69, 6.66 (multi-column HPLC-k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

7.05, 6.68 (quoted average values of Risby et al. 1990, Sangster 1993)

7.10 (recommended, Hansch et al. 1995)

7.0318 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.33 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.56 (suspended particulate matter, Burkhard 1984)
5.222 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29\text{--}60 \text{ d}$ at room temp. (Kwok et al. 1995)

Synonym: PCB-166, 2,3,4,4',5,6-hexachloro-1,1'-biphenyl

Chemical Name: 2,3,4,4',5,6-hexachlorobiphenyl

CAS Registry No: 41411-63-6

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

163.0 (Burkhard et al. 1985b)

160–165 (Erickson 1986)

145 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0443 (mp at $163^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0189 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

7.20×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

2.46×10^{-4} (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$):

1.175×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

0.00140 (GC-RI correlation, Burkhard et al. 1985b)

Henry's Law Constant (Pa·m³/mol at $25^{\circ}C$):

22.49 (calculated-P/C, Burkhard 1984)

17.43 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

18.65 (calculated-QSPR, Dunnivant et al. 1992)

49.5 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 79 \pm 18$ kJ/mol, $\Delta S_H = 0.23 \pm 0.06$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.62 (calculated-TSA, Burkhard 1984)

6.93 (calculated-TSA, Hawker & Connell 1988a)

7.13, 7.18; 6.90, 6.83 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

7.17, 6.87 (quoted average values of Risby et al. 1990, Sangster 1993)

7.31 (recommended, Hansch et al. 1995)

6.8501 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.08 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

6.42 (suspended particulate matter, Burkhard 1984)

5.259 (marine humic substances 5 mg/L of DOC, reported as association coefficient log K_h , calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29\text{--}60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.167 2,3',4,4',5,5'-Hexachlorobiphenyl (PCB-167)

Common Name: 2,3',4,4',5,5'-Hexachlorobiphenyl

Synonym: PCB-167, 2,3',4,4',5,5'-hexachloro-1,1'-biphenyl

Chemical Name: 2,3',4,4',5,5'-hexachlorobiphenyl

CAS Registry No: 52663-72-6

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

135 (calculated-molecular properties, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0128 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00223 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.00036 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.000531 (generator column-GC/ECD, Hong & Qiao 1995)

0.000107 (generator column-GC/ECD, measured range $5-35^{\circ}C$, Huang & Hong 2002)—see Comment by van Noort 2004

0.000442, 0.000682, 0.00107, 0.00161 ($5, 15, 25, 35^{\circ}C$, generator column-GC/ECD, Huang & Hong 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.88×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

2.12×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

2.80×10^{-4} , 2.39×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

2.34×10^{-4} (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4994/(T/K) + 13.20$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

5.33 (calculated-P/C, Burkhard et al. 1985a)

12.46 (calculated-QSPR-MCI χ , Sabljic & Güsten 1989)

20.55 (calculated-QSPR, Dunnivant et al. 1992)

4.47 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

39.28 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 106 \pm 8$ kJ/mol, $\Delta S_H = 0.32 \pm 0.03$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.29 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.24, 7.30; 7.00, 7.03 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

7.29 (recommended, Sangster 1993)

7.50 (recommended, Hansch et al. 1995)

6.82 (generator column-GC/ECD, Yeh & Hong 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or indicated:

- 12.07, 10.77; 10.76 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 10.59 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 5.97, 7.27 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.58 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 5.381 (as $\log K_h$, association coefficient with marine humic substance, calculated-MCI χ , Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29-60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

- $k_2 = 0.0263 \text{ d}^{-1}$ with an elimination $t_{1/2} = 26 \text{ d}$ (earthworm, Belfroid et al. 1995)
 $k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 134 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 153 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water: photodegradation $t_{1/2} = 38 \text{ min}$ when irradiated in a TiO_2 semiconductor aqueous suspension with a 1.5-kW Xenon lamp (De Felip et al. 1996)

Ground water:

Sediment:

Soil:

Biota: clearance $t_{1/2} = 50-100 \text{ d}$ in guppy for hexachlorobiphenyl (Bruggeman et al. 1984);
 reported biological half-lives for hexachlorobiphenyls: $t_{1/2} = 87$ to $> 850 \text{ d}$ for trout, $t_{1/2} = 77-91 \text{ d}$ for trout muscle; $t_{1/2} > 200 \text{ d}$ for carp; $t_{1/2} = 75-175 \text{ d}$ for guppy (Niimi 1987);
 elimination $t_{1/2} = 26.4 \text{ d}$ from earthworm (Belfroid et al. 1995)
 depuration $t_{1/2} = 134 \text{ d}$ for high-dose treatment, $t_{1/2} = 153 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.168 2,3',4,4',5',6-Hexachlorobiphenyl (PCB-168)

Common Name: 2,3',4,4',5',6-Hexachlorobiphenyl

Synonym: PCB-168, 2,3',4,4',5',6-hexachloro-1,1'-biphenyl

Chemical Name: 2,3',4,4',5',6-hexachlorobiphenyl

CAS Registry No: 59291-65-5

Molecular Formula: $C_{12}H_4Cl_6$

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

110–111 (Erickson 1986)

133 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

310.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0134 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

5.72×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

9.76×10^{-4} (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

4.87×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

5.40×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

6.88×10^{-4} , 6.24×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -4816/(T/K) + 12.99$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

13.07 (calculated-P/C, Burkhard 1984)

46.91 (calculated-QSAR-MCI χ , Sabljic & Güsten 1989)

27.97 (calculated-QSAR, Dunnivant et al. 1992)

49.5 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 79 \pm 18\ kJ/mol$, $\Delta S_H = 0.23 \pm 0.06\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.76 (calculated-TSA, Burkhard 1984)

7.11 (calculated-TSA, Hawker & Connell 1988a)

7.23, 7.13; 6.76, 6.71 (multi-column HPLC- k' correlation; capillary GC-RV correlation, different stationary phases, Risby et al. 1990)

7.18, 6.74 (quoted average values from Risby et al. 1990, Sangster 1993)

7.17 (recommended, Hansch et al. 1995)

6.8539 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.39 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.56 (suspended particulate matter, Burkhard 1984)

5.222 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calc-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:
 $k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for hexachlorobiphenyls, and the tropospheric lifetime $\tau(\text{calc}) = 29\text{--}60 \text{ d}$ at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_1 = 7200 \text{ d}^{-1}$; $k_2 = 0.00766 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)
 $k_1 = 2 \text{ (food lipid mg)/(g worm lipid-d)}$; $k_2 = 0.03 \text{ d}^{-1}$ (earthworm, Wågman et al. 2001)
 $k_2 = 0.0065 \text{ d}^{-1}$ with $t_{1/2} = 107 \text{ d}$ (newly contaminated oysters, Gardinali et al. 2004)
 $k_2 = 0.0082 \text{ d}^{-1}$ with $t_{1/2} = 85 \text{ d}$ (chronically contaminated oysters, Gardinali et al. 2004)

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995);
 $t_{1/2} = 6000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: photodegradation $t_{1/2} = 548 \text{ min}$ when irradiated in a TiO_2 semiconductor aqueous suspension with a 1.5-kW high pressure Xenon lamp (De Felip et al. 1996);
 $t_{1/2} = 120000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Groundwater:

Sediment: $t_{1/2} = 165000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: $t_{1/2} = 165000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: elimination $t_{1/2} = 24 \text{ d}$ in earthworm given contaminated food (Wågman et al. 2001)

Depuration $t_{1/2} = 107 \text{ d}$ for newly contaminated oysters, and $t_{1/2} = 85 \text{ d}$ for chronically contaminated oysters (Gardinali et al. 2004)

7.1.1.170 2,2',3,3',4,4',5-Heptachlorobiphenyl (PCB-170)

Common Name: 2,2',3,3',4,4',5-Heptachlorobiphenyl

Synonym: PCB-170, 2,2',3,3',4,4',5-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,4',5-heptachlorobiphenyl

CAS Registry No: 35065-30-6

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

135 (Hutzinger et al. 1974; Brodsky & Ballschmiter 1988)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0833 (mp at $135^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00767 (supercooled liquid S_L , Burkhard et al. 1985b)

0.00347 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.000504 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.000395 (calculated-TSA, Abramowitz & Yalkowsky 1990)

0.00052 (calculated-MCI χ , Patil 1991)

0.000130 (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

8.37×10^{-5} (supercooled liquid P_L , GC-RT correlation, Bidleman 1984)

3.37×10^{-5} (GC-RI correlation, Burkhard et al. 1985a)

3.72×10^{-4} (supercooled liquid, GC-RI correlation, Burkhard et al. 1985b)

8.37×10^{-5} , 8.11×10^{-5} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

1.32×10^{-5} ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

5.13×10^{-5} , 7.76×10^{-5} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -5139/(T/K) + 13.07$ (supercooled liquid, GC-RT correlation, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

19.25 (calculated-P/C, Burkhard 1985b)

1.52 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

0.912 (wetted-wall column-GC, Brunner et al. 1990)

8.85 (calculated-QSPR, Dunnivant et al. 1992)

0.128, 0.760, 4.139, $20.84^* \pm 0.80$, 78.50 (4, 11, 18, 25, $31^{\circ}C$, gas stripping-GC, Bamford et al. 2000)

$\ln K_{AW} = 61.342 - 19725.76/(T/K)$; temp range 4 – $31^{\circ}C$ (gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(164.0/kJ\cdot mol^{-1})/RT] + (0.510/kJ\cdot mol^{-1}\cdot K^{-1})/R$; where $R = 8.314\ J\cdot K^{-1}\cdot mol^{-1}$ and temp range: 4 – $31^{\circ}C$, (gas stripping-GC, Bamford et al. 2000)

19.4 (exptl. data, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 164 \pm 9\ kJ/mol$, $\Delta S_H = 0.51 \pm 0.03\ kJ/mol\cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 7.05 (calculated-TSA, Burkhard 1984)
- 7.08 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)
- 7.27 (calculated-TSA, Hawker & Connell 1988a)
- 7.03 (calculated-MCI χ , Patil 1991)
- 7.30 (calculated-TSA, Murray & Andren 1992)
- 6.83 (generator column-GC, Larsen et al. 1992)
- 6.96 (recommended, Sangster 1993)
- 7.10 (estimated, Girvin & Scott 1997)
- 7.0639 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 11.42 (10°C, estimated, Thomas et al. 1998)
- 12.34, 11.07; 11.02 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
- 10.69 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 2.43–4.76 (various marine species, mean dry wt. BCF, Hope et al. 1998)
- 3.75–4.61 (Various marine species, mean lipid-normalized BCF, Hope et al. 1999)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.85 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
- 5.63, 5.48, 5.42, 4.99 (marine humic substances, in concentrations. of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
- 5.632, 5.675 (marine humic substances of 5 mg/L DOC, quoted; calculated-MCI χ , reported as association coefficient $\log K_h$, Sabljic et al. 1989)
- 6.10 (colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 6.60 (soil, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 164 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 180 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 164 \text{ d}$ for high-dose treatment, $t_{1/2} = 180 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.171 2,2',3,3',4,4',6-Heptachlorobiphenyl (PCB-171)

Common Name: 2,2',3,3',4,4',6-Heptachlorobiphenyl

Synonym: PCB-171, 2,2',3,3',4,4',6-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,4',6-heptachlorobiphenyl

CAS Registry No: 52663-71-5

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

117.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

250.3 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

20.29 (Miller et al. 1984; Ruelle et al. 1993)

22.80 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

51.04 (Miller et al. 1984; Shiu & Mackay 1986)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 0.124 (mp at $117.5^{\circ}C$)

0.109 (Mackay et al. 1980; Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.00624 (shake flask-GC/ECD, Dexter & Pavlou 1978)

0.00217 (generator column-GC/ECD, Miller et al. 1984,1985)

0.00412 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

9.81×10^{-6} (calculated-UNIFAC activity coefficients, Banerjee & Howard 1988)

0.00102, 0.000687, 0.000521 (RP-HPLC-k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.87×10^{-4} , 2.98×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Bidleman 1984)

5.71×10^{-4} (GC-RI correlation, Burkhard et al. 1985a)

4.69×10^{-4} (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

2.57×10^{-4} , 3.17×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

2.73×10^{-5} , 2.50×10^{-4} (selected, solid P_S ; supercooled liquid P_L , Shiu & Mackay 1986)

1.26×10^{-4} , 2.09×10^{-4} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -5008/(T/K) + 13.07$ (supercooled liquid, GC-RT correlation, Falconer & Bidleman 1994)

9.77×10^{-5} ($20^{\circ}C$, supercooled liquid P_L from Falconer & Bidleman 1994, Harner & Bidleman 1996)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

29.79 (calculated-P/C, Burkhard et al. 1985b)

5.40 (calculated-P/C, Shiu & Mackay 1986)

17.49 (calculated-QSPR, Dunnivant et al. 1992)

1.50 (calculated-QSPR, Achman et al. 1993)

59.9 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 101 \pm 9$ kJ/mol, $\Delta S_H = 0.31 \pm 0.03$ kJ/mol·K
 (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.14 (calculated-TSA, Burkhard 1984)
 6.68 (generator column-GC/ECD, Miller et al. 1984,1985)
 7.85 (calculated-UNIFAC activity coefficients, Banerjee & Howard 1988)
 7.04, 7.06 (RP-HPLC- k' correlation, different mobile phases, Brodsky & Ballschmiter 1988)
 7.11 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)
 6.99 (recommended, Sangster 1993)
 6.68 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations:

9.50 (calculated- K_{OW}/K_{AW} , Wania & Mackay 1996)
 10.51 (20°C, generator column-GC, measured range -10 to 30°C, Harner & Bidleman 1996)
 12.31, 11.78, 11.14, 10.51, 9.96 (-10, 0, 10, 20, 30°C, generator column-GC, Harner & Mackay 1995)
 $\log K_{OA} = -5.71 + 4757/(T/K)$; (temp range -10 to 30°C, Harner & Bidleman 1996)
 11.76, 10.51; 10.50 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 10.76 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.94 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 5.516 (marine humic substances of 5 mg/L DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.004$ d⁻¹ with $t_{1/2} = 156$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004$ d⁻¹ with $t_{1/2} = 182$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} = 260$ d in worms at 8°C (Oliver 1987c).

depuration $t_{1/2} = 156$ d for high-dose treatment, $t_{1/2} = 182$ d for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.172 2,2',3,3',4,5,5'-Heptachlorobiphenyl (PCB-172)

Common Name: 2,2',3,3',4,5,5'-Heptachlorobiphenyl

Synonym: PCB-172, 2,2',3,3',4,5,5'-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,5,5'-heptachlorobiphenyl

CAS Registry No: 52663-74-8

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

113 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00688 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00430 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

3.14×10^{-4} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

4.98×10^{-4} (calculated-TSA and mp., Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

5.55×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

6.14×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

1.41×10^{-4} (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -5109/(T/K) + 12.28$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

31.82 (calculated-P/C, Burkhard 1984)

1.317 (wetted wall column-GC/ECD, Brunner et al. 1990)

12.07 (calculated-QSPR, Dunnivant et al. 1992)

28.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 149 \pm 13 kJ/mol$, $\Delta S_H = 0.46 \pm 0.04 kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.10 (calculated-TSA, Burkhard 1984)

7.21 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

6.85 (generator column-GC, Larsen et al. 1992)

7.33 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

7.03 (recommended, Sangster 1993)

7.2349 (molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated:

11.84, 10.67 (0, $20^{\circ}C$, multi-column GC- k' correlation, Zhang et al. 1999)

10.50 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

- 6.89 (suspended particulate matter, Burkhard 1984)
- 5.71, 5.44, 5.38, 4.97 (marine humic substances, in concentrations. of 5, 10, 20, 40 mg/L DOC, reported as association coefficient log K_h , Lara & Ernst 1989)
- 5.711; 5.66 (marine humic substances with 5 mg/L DOC, reported as association coefficient log K_h , observed; calculated-MCI $^1\chi$, Sabljic et al. 1989)

Environmental Fate Rate Constants, k, and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 165 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 179 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 165 \text{ d}$ for high-dose treatment, $t_{1/2} = 179 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.173 2,2',3,3',4,5,6-Heptachlorobiphenyl (PCB-173)

Common Name: 2,2',3,3',4,5,6-Heptachlorobiphenyl

Synonym: PCB-173, 2,2',3,3',4,5,6-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,5,6-heptachlorobiphenyl

CAS Registry No: 68194-16-1

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

145 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00731 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00416 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

6.265×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$):

5.55×10^{-5} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

6.14×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

29.89 (calculated-P/C, Burkhard 1984)

1.42 (wetted wall column-GC/ECD, Brunner et al. 1990)

18.48 (calculated-QSPR, Dunnivant et al. 1992)

59.9 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 101 \pm 9\ kJ/mol$, $\Delta S_H = 0.31 \pm 0.03\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.07 (calculated-TSA, Burkhard 1984)

7.02 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

7.30 (calculated-TSA, Murray & Andren 1992)

6.9556 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated:

11.79, 10.60 (0, $20^{\circ}C$, multi-column GC- k' correlation, Zhang et al. 1999)

10.48 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

- 6.87 (suspended particulate matter, Burkhard 1984)
- 5.532 (marine humic substances 5 mg/L of DOC, reported as association coefficient log K_h , calculated-molecular connectivity indices, Sabljic et al. 1989)
- 6.40 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 2$ (food lipid mg)/(g worm lipid-d); $k_2 = 0.03$ d⁻¹ (earthworm, Wågman et al. 2001)

$k_2 = 0.004$ d⁻¹ with $t_{1/2} = 162$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004$ d⁻¹ with $t_{1/2} = 186$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: elimination $t_{1/2} = 20$ d in earthworm given contaminated food (Wågman et al. 2001)

depuration $t_{1/2} = 162$ d for high-dose treatment, $t_{1/2} = 186$ d for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.174 2,2',3,3',4,5,6'-Heptachlorobiphenyl (PCB-174)

Common Name: 2,2',3,3',4,5,6'-Heptachlorobiphenyl

Synonym: PCB-174, 2,2',3,3',4,5,6'-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,5,6'-heptachlorobiphenyl

CAS Registry No: 38411-25-5

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

130.6 (Burkhard 1985b)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (KJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.092 (mp at $130.6^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.00625 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00525 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.001016 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

6.687×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

3.191×10^{-4} (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

1.206×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

1.19×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

1.80×10^{-4} , 2.43×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

6.69×10^{-5} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

2.75×10^{-4} (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4962/(T/K) + 12.90$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

93.53 (calculated-P/C, Burkhard 1984)

4.96 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

1.419 (wetted wall column-GC/ECD, Brunner et al. 1990;)

17.13 (calculated-QSPR, Dunnivant et al. 1992)

4.91 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

49.6 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 113 \pm 11$ kJ/mol, $\Delta S_H = 0.35 \pm 0.04$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

7.14 (calculated-TSA, Burkhard 1984)

6.85 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.11 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

- 6.85 (recommended, Sangster 1993)
7.10 (estimated, Girvin & Scott 1997)
6.9132 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 11.67, 10.51; 10.64 (0, 20°C, multi-column GC-k' correlation; calculated at 20°C, Zhang et al. 1999)
10.38 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Biota Sediment Accumulation Factor, BSAF:

- 89 (trout in Lake Ontario, Niimi 1996)
0.29, 2.8, 1.4 (grass shrimp, striped mullet, sea trout muscle, Maruya & Lee 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.94 (suspended particulate matter, Burkhard 1984)
5.52 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)
5.82 (Ispra soil, shake flask-GC, Paya-Perez et al. 1991)
6.60 (soil-organic carbon, calculated- K_{OW} , Girvin & Scott 1979)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

- $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 160 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 194 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 160 \text{ d}$ for high-dose treatment, $t_{1/2} = 194 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.175 2,2',3,3',4,5',6-Heptachlorobiphenyl (PCB-175)

Common Name: 2,2',3,3',4,5',6-Heptachlorobiphenyl

Synonym: PCB-175, 2,2',3,3',4,5',6-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,5',6-heptachlorobiphenyl

CAS Registry No: 40186-70-7

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

133 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.00557 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00894 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.00104 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

4.98×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

7.00×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

7.72×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

3.98×10^{-4} (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4962/(T/K) + 12.22$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

49.55 (calculated-P/C, Burkhard 1984)

22.63 (calculated-QSPR, Dunnivant et al. 1992)

2.069 (calculated-QSPR, Achman et al. 1993)

59.9 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 101 \pm 9\ kJ/mol$, $\Delta S_H = 0.31 \pm 0.03\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.19 (calculated-TSA, Burkhard 1984)

6.92 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988a)

7.17 (calculated-TSA, Hawker & Connell 1988; quoted, Hansch et al. 1995)

6.92 (recommended, Sangster 1993)

7.10 (estimated, Girvin & Scott 1997)

7.0957 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated:

11.35, 10.17 (0, $20^{\circ}C$, multi-column GC- k' correlation, Zhang et al. 1999)

10.83 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Biota Sediment Accumulation Factor, BSAF:

144 (trout in Lake Ontario, Niimi 1996)

Sorption Partition Coefficient, log K_{OC} :

6.99 (suspended particulate matter, Burkhard 1984)

5.501 (marine humic substances 5 mg/L of DOC, reported as association coefficient log K_h , calculated-molecular connectivity indices, Sabljic et al. 1989)

6.60 (soil-organic carbon, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 154 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 169 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 154 \text{ d}$ for high-dose treatment, $t_{1/2} = 169 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.176 2,2',3,3',4,6,6'-Heptachlorobiphenyl (PCB-176)

Common Name: 2,2',3,3',4,6,6'-Heptachlorobiphenyl

Synonym: PCB-176, 2,2',3,3',4,6,6'-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,6,6'-heptachlorobiphenyl

CAS Registry No: 52663-65-7

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

101 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

$\log(P_L/Pa) = -4962/(T/K) + 13.28$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

44.08 (calculated-P/C, Burkhard 1984)

6.586 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

2.33 (wetted wall column-GC/ECD, Brunner et al. 1990)

21.61 (calculated-QSPR, Dunnivant et al. 1992)

11.2 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

71.4 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 90 \pm 10\ kJ/mol$, $\Delta S_H = 0.27 \pm 0.03\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.17 (calculated-TSA, Burkhard 1984)

6.85 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.14 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.85 (recommended, Sangster 1993)

7.0564 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

11.28, 10.12 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)

10.33 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.97 (suspended particulate matter, Burkhard 1984)

5.501 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 156 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 166 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 156 \text{ d}$ for high-dose treatment, $t_{1/2} = 166 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.179 2,2',3,3',5,6,6'-Heptachlorobiphenyl (PCB-179)

Common Name: 2,2',3,3',5,6,6'-Heptachlorobiphenyl

Synonym: PCB-179, 2,2',3,3',5,6,6'-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',5,6,6'-heptachlorobiphenyl

CAS Registry No: 52663-64-6

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

99 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00632 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00454 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.0039 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

1.42×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

1.55×10^{-3} (GC-RI correlation, Burkhard et al. 1985b)

5.15×10^{-4} , 1.004×10^{-3} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

5.01×10^{-4} , 8.71×10^{-4} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4579/(T/K) + 12.07$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

88.96 (calculated-P/C, Burkhard 1984)

2.432 (wetted wall column-GC/ECD, Brunner et al. 1990)

27.91 (calculated-QSPR, Dunnivant et al. 1992)

37.3 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 144 \pm 7$ kJ/mol, $\Delta S_H = 0.45 \pm 0.03$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.77, 8.13 (RP-HPLC- k' correlation: uncorrected, with ortho correction, Rapaport & Eisenreich 1984)

7.14 (calculated-TSA, Burkhard 1984)

6.41 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

6.73 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.41 (recommended, Sangster 1993)

6.6366 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

11.26, 10.10 (0, 20°C, multi-column k' correlation, Zhang et al. 1999)

10.34 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.94 (suspended particulate matter, Burkhard 1984)

5.358 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 171 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 198 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 171 \text{ d}$ for high-dose treatment, $t_{1/2} = 198 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.180 2,2',3,4,4',5,5'-Heptachlorobiphenyl (PCB-180)

Common Name: 2,2',3,4,4',5,5'-Heptachlorobiphenyl

Synonym: PCB-180, 2,2',3,4,4',5,5'-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,4',5,5'-heptachlorobiphenyl

CAS Registry No: 35065-29-3

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

109–110 (Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$): 240–280 (20mm Hg)

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

250.3 (Ruelle & Kesselring 1997; Passivirta et al. 1999)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

56.5 (Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.144 (calculated-Mackay et al. 1992; Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

0.00656 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985b)

0.00385 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.00031 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.00063 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.00053 (calculated-MCI χ , Patil 1991)

2.45×10^{-4} (calculated-QSPR, Dunnivant et al. 1992)

$\log S_L$ (mol/L) = $-1.676 + 1132/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

3.17×10^{-3} ; 5.22×10^{-3} (supercooled liquid: LDV derivation of literature-derived value, FAV final-adjusted value, Li et al. 2003)

$\log S_L/(mol\ m^{-3}) = -1356/(T/K) - 0.33$ (supercooled liquid, FAV final adjusted eq., Li et al. 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

8.10×10^{-5} (Verlag Chemie 1983)

1.30×10^{-4} , 1.29×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Bidleman 1984)

8.07×10^{-5} (GC-RI correlation, Burkhard et al. 1985a)

5.06×10^{-4} (supercooled liquid P_L , calculated-GC-RI correlation, Burkhard 1985b)

1.21×10^{-4} , 1.43×10^{-4} (supercooled liquid. P_L , GC-RT correlation, different stationary phases Foreman & Bidleman 1985)

3.14×10^{-5} ($20^{\circ}C$, supercooled liquid, calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

8.13×10^{-5} , 1.20×10^{-4} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log (P_L/Pa) = -5042/(T/K) + 13.03$ (GC-RT correlation, Falconer & Bidleman 1994)

1.45×10^{-4} , 2.09×10^{-5} (supercooled liquid P_L , solid P_S , Passivirta et al. 1999)

$\log (P_S/Pa) = 15.98 - 6173/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 13.03 - 5042/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

1.32×10^{-4} ; 1.072×10^{-4} (supercooled P_L : LDV literature derived value, FAV final adjusted value, Li et al. 2003)

$\log P_L/Pa = -4809/(T/K) + 12.16$ (supercooled liquid, FAV final adjusted eq., Li et al. 2003)

Henry's Law Constant (Pa m³/mol at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 30.40 (calculated-P/C, Burkhard et al. 1985b)
- 3.24 (20°C, calculated-P/C, Murphy et al. 1987)
- 1.013 (wetted-wall column-GC/ECD, Brunner et al. 1990)
- 10.88 (calculated-QSPR, Dunnivant et al. 1992)
- 7.10 (estimated, Girvin & Scott 1997)
- $\log H/(\text{Pa m}^3/\text{mol}) = 14.71 - 3910/(T/K)$ (Passivirta et al. 1999)
- 37.0* \pm 0.20 (gas stripping-GC, measured range 4–31°C, Bamford et al. 2000)
- $K_{AW} = \exp[-(143.6/\text{kJ}\cdot\text{mol}^{-1})/RT] + (0.447/\text{kJ}\cdot\text{mol}^{-1}\cdot\text{K}^{-1})/R$; where $R = 8.314 \text{ J}\cdot\text{K}^{-1}\cdot\text{mol}^{-1}$ and temp range: 4–31°C, (gas stripping-GC, Bamford et al. 2000)
- 37.3 (exptl. data, Bamford et al. 2002)—see Comment by Goss et al. 2004
- $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 144 \pm 7 \text{ kJ/mol}$, $\Delta S_H = 0.45 \pm 0.03 \text{ kJ/mol}\cdot\text{K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004
- 5.89, 8.51 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)
- $\log H/(\text{Pa m}^3/\text{mol}) = -3453/(T/K) + 12.49$ (FAV final adjusted eq., Li et al. 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 7.12 (calculated-TSA, Burkhard 1984)
- 6.70 (calculated-chlorine substituents, Oliver 1987a)
- 7.21 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)
- 7.36 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)
- 7.02 (calculated-MCI χ , Patil 1991)
- 7.40 (calculated-TSA, Murray & Andren 1992)
- 6.56 (average, generator column-GC, Larsen et al. 1992)
- 6.89 (recommended, Sangster 1993)
- 7.2506 (calculated-molecular properties MNDO-AM1, Makino 1998)
- 7.20 (calculated, Passivirta et al. 1999)
- 7.29, 7.16 (LDV literature-derived value, FAV final adjusted value, Li et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations:

- 10.75* (20°C, generator column-GC, measured range –10 to 30°C, Harner & Bidleman 1996)
- $\log K_{OA} = -4.70 + 4535/(T/K)$; (temp range –10 to 30°C, Harner & Bidleman 1996)
- 9.88; 9.72 (fugacity meter/generator column-GC; calculated, Kömp & McLachlan 1997a)
- $\log K_{OA} = -3.31 + 3930/(T/K)$; (fugacity meter, temp range 10–43°C, Kömp & McLachlan 1997a)
- 11.22 (10°C, estimated, Thomas et al. 1998)
- 9.88 (quoted, Kömp & McLachlan 1997b; Kaupp & McLachlan 1999)
- 11.94, 10.72; 10.86 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
- 10.85 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)
- 10.12, 10.16 (LDV literature derived value, FAV final adjusted value, Li et al. 2003)
- $\log K_{OA} = 4975/(T/K) - 6.55$ (LDV linear regression of literature data, Li et al. 2003)
- $\log K_{OA} = 4845/(T/K) - 6.09$ (FAV final adjusted eq., Li et al. 2003)

Bioconcentration Factor, $\log BCF$:

- 2.99–5.68 (various marine species, mean dry wt. BCF, Hope et al. 1998)
- 4.22–6.41 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)
- 4.45, 6.45 (*Daphnia magna*, 21-d exposure: wet wt basis, lipid wt basis, Geyer et al. 2000)
- 6.06, 7.36 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$ at 25°C or as indicated:

- 6.92 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
- 6.2–7.4, 6.9; 7.30 (suspended sediments, range; average, algae > 50 μm , Oliver 1987a)
- 6.51 (Lake Michigan water column, Swackhamer & Armstrong 1987)

- 5.73, 5.54, 5.50, 5.09 (marine humic substances, in concentrations of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
- 5.73; 5.66 (marine humic substances at 5 mg/L DOC, quoted; calculated-MCI χ , reported as $\log K_h$, Sabljic et al. 1989)
- 6.36, 6.23, 6.10 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)
- 5.78 (Ispra soil, shake flask-GC/ECD, Paya-Perez et al. 1991)
- 6.60 (colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 6.60 (soil, calculated- K_{ow} , Girvin & Scott 1997)
- 6.53–7.76; 5.80–7.80 (range, calculated from sequential desorption of 11 urban soils; lit. range, Krauss & Wilcke 2001)
- 5.42; 6.56, 7.42, 6.83 (20°C, batch equilibrium, A2 alluvial grassland soil; calculated values of expt 1,2,3-solvophobic approach, Krauss & Wilcke 2001)
- 6.31–6.98 (field contaminated sediment, initial-final values for 2–1461 d contact time, gas-purge technique-GC/ECD, ten Hulscher et al. 2003)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 0.049 \text{ h}^{-1}$; $k_1 = 0.008 \text{ h}^{-1}$ (mayfly-sediment model II, Gobas et al. 1989)

$k_2 = 0.0246 \text{ d}^{-1}$ with an elimination $t_{1/2} = 282 \text{ d}$ (earthworm, Belfroid et al. 1995)

$k_1 = 0.00348 \text{ h}^{-1}$; $k_2 = 0.111 \text{ h}^{-1}$ (blood plasma of ring doves, Drouillard & Norstrom 2000)

$k_1(\text{calc}) = 2$ (food lipid mg)/(g worm lipid-d); $k_2(\text{calc}) = 0.03 \text{ d}^{-1}$ (earthworm, Wågman et al. 2001)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 162 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 186 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

$k_2 = 0.021 \text{ d}^{-1}$ with $t_{1/2} = 33.0 \text{ d}$ (juvenile carp in 100-d experiment Stapleton et al. 2004)

Half-Lives in the Environment:

Air: $t_{1/2} = 12000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: $t_{1/2} = 240000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: very persistent, $t_{1/2} = 25 \text{ yr}$ (Geyer et al. 2000)

$t_{1/2} = 330000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: $t_{1/2} = 333000 \text{ h}$ at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: elimination $t_{1/2} = 28.3 \text{ d}$ from earthworm (Belfroid et al. 1995);

elimination $t_{1/2} = 22 \text{ d}$ in earthworm given contaminated food (predicted, Wågman et al. 2001)

depuration $t_{1/2} = 162 \text{ d}$ for high-dose treatment, $t_{1/2} = 186 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

depuration $t_{1/2} = 33.0 \text{ d}$ (juvenile carp in 100-d experiment Stapleton et al. 2004)

TABLE 7.1.1.180.1

Reported Henry's law constants and octanol-air partition coefficients of 2,2',3,4,4',5,5'-heptachlorobiphenyl (PCB-180) at various temperatures and temperature dependence equations

Henry's law constant		log K _{OA}	
Bamford et al. 2000		Harner & Bidleman 1996	
gas stripping-GC/MS		generator column-GC	
t/°C	H/(Pa m ³ /mol)	t/°C	log K _{OA}
4	0.425	-10	12.46
11	2.025	0	12.00
18	8.96	10	11.38
25	37.0	20	10.75
31	118.5	30	10.23

$\ln K_{AW} = -\Delta H/RT + \Delta S/R$		$\Delta H_{OA}/(\text{kJ mol}^{-1}) = 86.83$	
A	53.7647	$\log K_{OA} = A + B/T$	
B	17272	A	-4.695
enthalpy, entropy change:		B	4535
$\Delta H/(\text{kJ}\cdot\text{mol}^{-1}) = 143.6 \pm 7.4$			
$\Delta S/(\text{J}\cdot\text{mol}^{-1}\cdot\text{K}^{-1}) = 447 \pm 26$			

FIGURE 7.1.1.180.1 Logarithm of Henry's law constant and K_{OA} versus reciprocal temperature for 2,2',3,4,4',5,5'-heptachlorobiphenyl (PCB-180).

7.1.1.181 2,2',3,4,4',5,6-Heptachlorobiphenyl (PCB-181)

Common Name: 2,2',3,4,4',5,6-Heptachlorobiphenyl

Synonym: PCB-181, 2,2',3,4,4',5,6-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,4',5,6-heptachlorobiphenyl

CAS Registry No: 74472-47-2

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

140 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00625 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

4.44×10^{-4} , 5.21×10^{-4} , 2.30×10^{-4} , 4.54×10^{-4} (RP-HPLC- k' correlation, different stationary and mobile phases Brodsky & Ballschmiter 1988)

3.95×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

6.44×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

7.11×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

2.92×10^{-4} , 4.206×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

3.54×10^{-4} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

$\log(P_L/Pa) = -4962/(T/K) + 13.11$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

40.83 (calculated-P/C, Burkhard 1984)

23.31 (calculated-QSPR, Dunnivant et al. 1992)

59.9 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 101 \pm 9$ kJ/mol, $\Delta S_H = 0.31 \pm 0.03$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.14 (calculated-TSA, Burkhard 1984)

7.11, 7.12, 7.19, 7.11 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

7.11 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

7.13 (recommended, Sangster 1993)

7.0558 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.61 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log K_B$ or $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.94 (suspended particulate matter, Burkhard 1984)

5.516 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constant and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

7.1.1.182 2,2',3,4,4',5,6'-Heptachlorobiphenyl (PCB-182)

Common Name: 2,2',3,4,4',5,6'-Heptachlorobiphenyl

Synonym: PCB-182, 2,2',3,4,4',5,6'-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,4',5,6'-heptachlorobiphenyl

CAS Registry No: 60145-23-5

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

152 (Brodsky & Ballschmiter 1988)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 0.0567 (mp at $152^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

5.34×10^{-3} (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

8.26×10^{-4} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

3.95×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

1.36×10^{-4} (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.31×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

1.43×10^{-3} (GC-RI correlation, Burkhard et al. 1985b)

3.66×10^{-4} , 3.56×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

2.14×10^{-4} , 3.72×10^{-4} (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4962/(T/K) + 13.11$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

97.07 (calculated-P/C, Burkhard 1984)

26.04 (calculated-QSPR, Dunnivant et al. 1992)

2.07 (calculated-QSPR, Achman et al. 1993)

8.71 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

63.8 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 97 \pm 10\ kJ/mol$, $\Delta S_H = 0.30 \pm 0.04\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.22 (calculated-TSA, Burkhard 1984)

6.92 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.20 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.92 (recommended, Sangster 1993)

7.0964 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.42 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

7.02 (suspended particulate matter, Burkhard 1984)

5.501 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calc-molecular connectivity indices, Sabljic et al. 1989)

6.10 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 159 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 182 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 159 \text{ d}$ for high-dose treatment, $t_{1/2} = 182 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.183 2,2',3,4,4',5',6-Heptachlorobiphenyl (PCB-183)

Common Name: 2,2',3,4,4',5',6-Heptachlorobiphenyl

Synonym: PCB-183, 2,2',3,4,4',5',6-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,4',5',6-heptachlorobiphenyl

CAS Registry No: 52663-69-1

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

152 (estimated, Abramowitz & Yalkowsky 1990)

83 (Kühne et al. 1995; Ruelle & Kesselring 1997; Ran et al. 2002)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

250.3 (Kühne et al. 1995; Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.270 (mp at $83^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.00534 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00490 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

3.14×10^{-4} , 4.98×10^{-4} , 6.27×10^{-4} , 5.09×10^{-4} (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

3.14×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

0.000641 (calculated-group contribution method, Kühne et al. 1995)

9.27×10^{-4} , 2.49×10^{-3} (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

1.77×10^{-3} (calculated-mp and K_{OW} , Ran et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

6.38×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

7.05×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

3.57×10^{-4} , 5.09×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

8.61×10^{-5} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

2.0×10^{-4} , 3.24×10^{-4} (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4962/(T/K) + 13.19$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

47.32 (calculated-P/C, Burkhard 1984)

6.89 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

20.40 (calculated-QSPR, Dunnivant et al. 1992)

2.069 (calculated-QSPR, Achman et al. 1993)

0.326, 0.954 (0, $15^{\circ}C$, from modified two-film exchange model, Hornbuckle et al. 1994)

8.02 ($11^{\circ}C$, gas stripping-GC/ECD, Bamford et al. 2002)

61.5 (from $11^{\circ}C$ exptl. data and compensation point, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 100 \pm 10$ kJ/mol, $\Delta S_H = 0.30 \pm 0.04$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 7.22 (calculated-TSA, Burkhard 1984)
- 7.02, 7.13, 6.96, 7.07 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
- 7.20 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)
- 6.78 (generator column-GC, Larsen et al. 1992)
- 6.92 (recommended, Sangster 1993)
- 7.0868 (calculated-molecular properties MNDO-AM1 method, Makino 1998)
- 8.27 (calculated-CLOGP ver. 4, Ran et al. 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 10.80 (10°C, estimated, Thomas et al. 1998)
- 11.44, 10.26; 10.35 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
- 10.83 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 5.84, 7.37 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)

Biota Sediment Accumulation Factor, BSAF:

- 220 (trout in Lake Ontario, Niimi 1996)
- 0.52, 4.2, 0.84 (grass shrimp, striped mullet, sea trout muscle, Maruya & Lee 1998)

Sorption Partition Coefficient, $\log K_{oc}$:

- 7.02 (suspended particulate matter, Burkhard 1984)
- 5.53, 5.40, 5.35, 4.92 (marine humic substances, in concentrations. of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
- 5.53; 5.50 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, observed; calculated-molecular connectivity indices, Sabljic et al. 1989)
- 6.36, 6.25, 6.09 (North Sea sediments, field measurement-GC/ECD, Lara & Ernst 1990)
- 5.82 (Ispra soil, batch equilibrium-GC/ECD, Paya-Perez et al. 1991)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 165 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.003 \text{ d}^{-1}$ with $t_{1/2} = 206 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 165 \text{ d}$ for high-dose treatment, $t_{1/2} = 206 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.184 2,2',3,4,4',6,6'-Heptachlorobiphenyl (PCB-184)

Common Name: 2,2',3,4,4',6,6'-Heptachlorobiphenyl

Synonym: PCB-184, 2,2',3,4,4',6,6'-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,4',6,6'-heptachlorobiphenyl

CAS Registry No: 74472-48-3

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

108 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 5810 \text{ d}^{-1}$; $k_2 = 0.00677 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)
 $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 156 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 184 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} = 48 \text{ d}$ in *Picea omorika* (Reischl et al. 1989 from Reischl 1988).
 depuration $t_{1/2} = 156 \text{ d}$ for high-dose treatment, $t_{1/2} = 184 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.186 2,2',3,4,5,6,6'-Heptachlorobiphenyl (PCB-186)

Common Name: 2,2',3,4,5,6,6'-Heptachlorobiphenyl

Synonym: PCB-186

Chemical Name: 2,2',3,4,5,6,6'-heptachlorobiphenyl

CAS Registry No: 74472-49-4

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

142 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00672 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00157 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.35×10^{-3} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

1.47×10^{-3} (GC-RI correlation, Burkhard et al. 1985b)

4.68×10^{-4} , 7.55×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -4579/(T/K) + 12.03$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

79.13 (calculated-P/C, Burkhard 1984)

37.3 (calculated-QSPR, Dunnivant et al. 1992)

107.9 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 62 \pm 5$ kJ/mol, $\Delta S_H = 0.18 \pm 0.02$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.11 (calculated-TSA, Burkhard 1984)

6.69 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.7069 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.36 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

6.91 (suspended particulate matter, Burkhard 1984)

5.383 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota:

7.1.1.187 2,2',3,4',5,5',6-Heptachlorobiphenyl (PCB-187)

Common Name: 2,2',3,4',5,5',6-Heptachlorobiphenyl

Synonym: PCB-187, 2,2',3,4',5,5',6-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4',5,5',6-heptachlorobiphenyl

CAS Registry No: 52663-68-0

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

149.0 (Mackay et al. 1980; Burkhard et al. 1985a)

147 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

417 (calculated, Mackay et al. 1982; Shiu & Mackay 1986)

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

250.3 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0607 (mp at $149^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

4.70×10^{-4} (generator column-GC/ECD, Weil et al. 1974)

0.00451 ($20^{\circ}C$, supercooled liquid S_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

0.0826 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

3.05×10^{-4} (supercooled liquid P_L , GC-RT correlation, Bidleman 1984)

3.92×10^{-5} (GC-RI correlation, Burkhard et al. 1985a)

5.98×10^{-4} (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

3.47×10^{-4} , 5.74×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

9.42×10^{-5} ($20^{\circ}C$, supercooled liquid P_L , calculated-mole fraction of Aroclor mixtures, Murphy et al. 1987)

2.14×10^{-4} , 3.72×10^{-4} (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -4977/(T/K) + 12.96$ (supercooled liquid, GC-RT correlation, Falconer & Bidleman 1994)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

42.15 (calculated-P/C, Burkhard et al. 1985b)

8.41 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

20.55 (calculated-QSPR, Dunnivant et al. 1992)

2.07 (calculated-QSPR, Achman et al. 1993)

3.304, 8.72, 23.84, 82.20 ± 2.2 , 136.7 (4, 11, 18, 25, $31^{\circ}C$, gas stripping-GC, Bamford et al. 2000)

$\ln K_{AW} = 35.242 - 11582.87/(T/K)$; temp range 4 – $31^{\circ}C$ (gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(96.3/kJ \cdot mol^{-1})/RT] + (0.293/kJ \cdot mol^{-1} \cdot K^{-1})/R$; where $R = 8.314 J \cdot K^{-1} \cdot mol^{-1}$ and temp range: 4 – $31^{\circ}C$, (gas stripping-GC, Bamford et al. 2000)

65.9 (exptl. data, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 96 \pm 7$ kJ/mol, $\Delta S_H = 0.29 \pm 0.02$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.19	(calculated-TSA, Burkhard 1984)
6.92	(RP-HPLC-RI correlation, Brodsky & Ballschmiter 1988)
7.17	(calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)
7.40	(calculated-TSA, Murray & Andren 1992)
6.76	(generator column-GC, Larsen et al. 1992)
6.84	(recommended, Sangster 1993)
7.10	(estimated, Girvin & Scott 1997)
7.0464	(calculated-molar properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations:

9.87; 9.25	(fugacity meter/generator column-GC; calculated, Kömp & McLachlan 1997a)
$\log K_{OA} = -5.20 + 4490/(T/K)$	(fugacity meter, temp range 10–43°C, Kömp & McLachlan 1997a)
10.85	(10°C, estimated, Thomas et al. 1998)
11.36, 10.22	(0, 20°C, multi-column GC-k' correlation, Zhang et al. 1999)
10.54	(calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

3.51–5.48	(various marine species, mean dry wt. BCF, Hope et al. 1998)
4.94–6.05	(various marine species, mean lipid-normalized BCF, Hope et al. 1998)

Biota Sediment Accumulation Factor, BSAF:

244	(trout in Lake Ontario, Niimi 1996)
-----	-------------------------------------

Sorption Partition Coefficient, $\log K_{OC}$:

6.99	(suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
5.51, 5.40, 5.33, 4.90	(marine humic substances, in concentrations of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
5.51; 5.50	(marine humic substances of 5 mg/L DOC, quoted; calculated-MCI χ , reported as $\log K_h$, Sabljic et al. 1989)
6.60	(colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
6.60	(soil, calculated- K_{OW} , Girvin & Scott 1997)
6.40; 6.00	(soil, calculated-universal solvation model; quoted exptl., Winget et al. 2000)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 131 \text{ d}$ and $k_2 = 0.010 \text{ d}^{-1}$ with $t_{1/2} = 71 \text{ d}$ for food concn of 22 ng/g and 125 ng/g, respectively, in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)
- $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 159 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
- $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 190 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 71\text{--}131$ d in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

depuration $t_{1/2} = 159$ d for high-dose treatment, $t_{1/2} = 190$ d for high-dose + enzyme CYP1A-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.188 2,2',3,4',5,6,6'-Heptachlorobiphenyl (PCB-188)

Common Name: 2,2',3,4',5,6,6'-Heptachlorobiphenyl

Synonym: PCB-188, 2,2',3,4',5,6,6'-heptachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4',5,6,6'-heptachlorobiphenyl

CAS Registry No: 74487-85-7

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

130 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

0.00538 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

0.00451 ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

0.00128 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

0.00125 (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

1.55×10^{-3} (S_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

9.55×10^{-4} , 1.69×10^{-3} , 2.96×10^{-5} (P_L supercooled liquid values: calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

8.51×10^{-4} , 1.50×10^{-3} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

9.42×10^{-5} ($20^{\circ}C$, supercooled liquid, Murphy et al. 1987)

$\log(P_L/Pa) = -4579/(T/K) + 13.29$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

113.5 (calculated-P/C, Burkhard 1984)

8.41 ($20^{\circ}C$, calculated-P/C, Murphy et al. 1987)

44.95 (calculated-QSPR, Dunnivant et al. 1992)

15.77, 31.39, 60.5, 113.1 ± 4.0 , 188.6 (4, 11, 18, 25, $31^{\circ}C$, gas stripping-GC, Bamford et al. 2000)

$\ln K_{AW} = 21.891 - 7457.3/(T/K)$; temp range $4-31^{\circ}C$ (gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(62.0/kJ \cdot mol^{-1})/RT] + (0.182/kJ \cdot mol^{-1} \cdot K^{-1})/R$; where $R = 8.314 J \cdot K^{-1} \cdot mol^{-1}$ and temp range: $4-31^{\circ}C$, (gas stripping-GC, Bamford et al. 2000)

107.9 (exptl. data, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 62 \pm 5$ kJ/mol, $\Delta S_H = 0.18 \pm 0.02$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.21 (calculated-TSA, Burkhard 1984)

6.78 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

- 6.82 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)
6.78 (recommended, Sangster 1993)
6.7947 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

- 10.22 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 7.01 (suspended particulate matter, Burkhard 1984)
5.342 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$$k_1 = 2 \text{ (food lipid mg)/(g worm lipid-d)}; k_2 = 0.03 \text{ d}^{-1} \text{ (earthworm, Wågman et al. 2001)}$$

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: elimination $t_{1/2} = 21 \text{ d}$ in earthworm given contaminated food (Wågman et al. 2001)

7.1.1.189 2,3,3',4,4',5,5'-Heptachlorobiphenyl (PCB-189)

Common Name: 2,3,3',4,4',5,5'-Heptachlorobiphenyl

Synonym: PCB-189, 2,3,3',4,4',5,5'-heptachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4,4',5,5'-heptachlorobiphenyl

CAS Registry No: 39635-31-9

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

170 (Burkhard et al. 1985b)

163 (Brodsky & Ballschmiter 1988)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0378 (mp at $170^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.0063 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

7.53×10^{-5} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

6.26×10^{-5} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

1.30×10^{-4} ; 4.47×10^{-5} (generator column-GC/ECD, estimated, Hong & Qiao 1995)

4.05×10^{-4} (calculated-mp and K_{ow} , Ran et al. 2002)

0.000063 (generator column-GC/ECD, measured range $5-35^{\circ}C$, Huang & Hong 2002)—see Comment by van Noort 2004

0.000029, 0.000044, 0.000063, 0.000136 ($5, 15, 25, 35^{\circ}C$, generator column-GC/ECD, Huang & Hong 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.44×10^{-4} (P_L supercooled liquid GC-RT correlation, Burkhard et al. 1985a)

5.95×10^{-5} (GC-RI correlation, Burkhard et al. 1985b)

4.77×10^{-5} , 3.30×10^{-5} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

2.69×10^{-5} (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -5300/(T/K) + 13.46$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

9.18 (calculated-P/C, Burkhard et al. 1985a)

6.74 (calculated-QSPR, Dunnivant et al. 1992)

0.903 (calculated-QSPR, Achman et al. 1993)

28.8 (estimated based on homolog group and ortho chlorine number, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 149 \pm 13$ kJ/mol, $\Delta S_H = 0.46 \pm 0.04$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

7.14 (calculated-TSA, Burkhard 1984)

7.72 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.71 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

- 6.75 (generator column-GC, Larsen et al. 1992)
- 7.24 (recommended, Sangster 1993)
- 7.15 (generator column-GC/ECD, Yeh & Hong 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 12.81, 11.54; 11.45 (0, 20°C, multi-column GC-k' correlation; calculated at 20°C, Zhang et al. 1999)
- 11.15 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 6.41, 7.71 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.94 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
- 5.817 (as $\log K_h$, association coefficient with marine humic substance, calculated- χ , Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.011 \text{ d}^{-1}$ with $t_{1/2} = 64 \text{ d}$ and $k_2 = 0.012 \text{ d}^{-1}$ with $t_{1/2} = 58 \text{ d}$ for food concn of 19 ng/g and 138 ng/g, respectively, in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 176 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 171 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: reported biological $t_{1/2} > 200 \text{ d}$ for heptachlorobiphenyls in carp (Niimi 1987)

Depuration $t_{1/2} = 58\text{--}64 \text{ d}$ in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

depuration $t_{1/2} = 176 \text{ d}$ for high-dose treatment, $t_{1/2} = 171 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.190 2,3,3',4,4',5,6-Heptachlorobiphenyl (PCB-190)

Common Name: 2,3,3',4,4',5,6-Heptachlorobiphenyl

Synonym: PCB-190, 2,3,3',4,4',5,6-heptachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4,4',5,6-heptachlorobiphenyl

CAS Registry No: 41411-64-7

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

117.0 (Burkhard et al. 1985b)

116 (Brodsky & Ballschmiter 1988)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.125 (mp at $117^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00767 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

4.98×10^{-4} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

1.98×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

2.20×10^{-4} (calculated-QSPR, Dunnivant et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.96×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

2.70×10^{-5} (GC-RI correlation, Burkhard et al. 1985b)

1.09×10^{-4} , 1.47×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

5.13×10^{-5} , 7.08×10^{-5} (supercooled liquid P_L : GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -5109/(T/K) + 13.17$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

10.06 (calculated-P/C, Burkhard 1984)

11.37 (calculated-QSPR, Dunnivant et al. 1992)

28.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 149 \pm 13 kJ/mol$, $\Delta S_H = 0.46 \pm 0.04 kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.05 (calculated-TSA, Burkhard 1984)

7.08 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.46 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

7.08 (recommended, Sangster 1993)

7.2887 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated:

12.09, 10.87 (0, $20^{\circ}C$, multi-column GC- k' correlation, Zhang et al. 1999)

10.90 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

- 6.84 (suspended particulate matter, Burkhard 1984)
- 5.675 (marine humic substances 5 mg/L of DOC, reported as association coefficient log K_h , calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 2$ (food lipid (mg)/(g worm lipid-d); $k_2 = 0.03$ d⁻¹ (earthworm, Wågman et al. 2001)

$k_2 = 0.004$ d⁻¹ with $t_{1/2} = 160$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004$ d⁻¹ with $t_{1/2} = 184$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: elimination $t_{1/2} = 25$ d in earthworm given contaminated food (Wågman et al. 2001)

depuration $t_{1/2} = 160$ d for high-dose treatment, $t_{1/2} = 184$ d for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.191 2,3,3',4,4',5',6-Heptachlorobiphenyl (PCB-191)

Common Name: 2,3,3',4,4',5',6-Heptachlorobiphenyl

Synonym: PCB-191, 2,3,3',4,4',5',6-heptachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4,4',5',6-heptachlorobiphenyl

CAS Registry No: 74472-50-7

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

126 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

6.60×10^{-3} (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

3.14×10^{-4} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

1.98×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

2.89×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

9.55×10^{-4} , 2.04×10^{-4} , 5.68×10^{-6} (supercooled liquid P_L , calculated- MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

1.05×10^{-4} (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -5109/(T/K) + 13.15$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

17.33 (calculated-P/C, Burkhard 1984)

13.48 (calculated-QSAR, Dunnivant et al. 1992)

1.367 (calculated-QSPR, Achman et al. 1993)

28.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 149 \pm 13$ kJ/mol, $\Delta S_H = 0.46 \pm 0.04$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.12 (calculated-TSA, Burkhard 1984)

7.21 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.55 (calculated-TSA, Hawker & Connell 1988; quoted, Hansch et al. 1995)

7.21 (recommended, Sangster 1993)

7.3254 (calculated-molecular properties MNDO-AMI method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated:

12.07, 10.91; 10.93 (0, $20^{\circ}C$, multi-column GC- k' correlation; calculated at $20^{\circ}C$, Zhang et al. 1999)

11.10 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

6.92 (suspended particulate matter, Burkhard 1984)

5.659 (marine humic substances 5 mg/L of DOC, reported as association coefficient log K_h , calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

7.1.1.192 2,3,3',4,5,5',6-Heptachlorobiphenyl (PCB-192)

Common Name: 2,3,3',4,5,5',6-Heptachlorobiphenyl

Synonym: PCB-192, 2,3,3',4,5,5',6-heptachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4,5,5',6-heptachlorobiphenyl

CAS Registry No: 74472-51-8

Molecular Formula: $C_{12}H_3Cl_7$

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

142 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

330.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

6.92×10^{-3} (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

3.14×10^{-4} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

1.57×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.89×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

9.55×10^{-4} , 3.23×10^{-4} , 2.96×10^{-5} (P_L , calculated-MW, GC-RI correlation, calculated-MCI χ , Burkhard et al. 1985b)

1.75×10^{-4} , 2.49×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

9.12×10^{-5} , 1.41×10^{-4} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -5109/(T/K) + 13.38$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

16.52 (calculated-P/C, Burkhard 1984)

19.40 (calculated-QSPR, Dunnivant et al. 1992)

1.37 (calculated-QSPR, Achman et al. 1993)

28.8 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 149 \pm 13\ kJ/mol$, $\Delta S_H = 0.46 \pm 0.04\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.09 (calculated-TSA, Burkhard 1984)

7.21 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.52 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

7.21 (recommended, Sangster 1993)

7.409 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

10.81 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

6.89 (suspended particulate matter, Burkhard 1984)

5.659 (marine humic substances 5 mg/L of DOC, reported as association coefficient log K_h , calculated-molecular connectivity indices, Sabljic et al. 1989)

4.35 (guppy, calculated- C_B/C_W or k_1/k_2 , Connell & Hawker 1988; Hawker 1990)

4.81 (guppy, estimated, Banerjee & Baughman 1991)

5.81; 7.34 (22°C, zebrafish: $\log BCF_W$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)

5.81, 7.35 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

7.27 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)

6.5–7.1, 6.8; 7.80 (suspended sediment, average; algae > 50 μm , Oliver 1987a)

5.94, 5.72, 5.68, 5.36 (marine humic substances, in concentrations. of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)

5.943, 6.016 (marine humic substances or 5 mg/L DOC, quoted; calculated-MCI χ , reported as $\log K_h$, Sabljic et al. 1989)

6.41, 6.20, 6.06 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)

6.96 (soil, calculated-Characteristic Root Index CRI model, Saçan & Balcioglu 1996)

7.30 (soil, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 > 0.0007$ d⁻¹ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)

$k_1 = 150$ d⁻¹; $k_2 = 0.007$ d⁻¹ (guppy, Bruggeman et al. 1984)

$k_1 = 1000$ d⁻¹ (guppy, Opperhuizen 1986)

$\log k_1 = 2.18 \text{ d}^{-1}$; $\log 1/k_2 = 2.15 \text{ d}$ (fish, quoted, Connell & Hawker 1988)

$k_1 = 5640 \text{ d}^{-1}$; $k_2 = 0.00865 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 158 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 174 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} > 1000 \text{ d}$ in rainbow trout and $t_{1/2} = 78 \text{ d}$ in its muscle (Niimi & Oliver 1983);

$t_{1/2} = 100 \text{ d}$ in guppy (Bruggeman et al. 1984);

$t_{1/2} = 220 \text{ d}$ in worms at 8°C (Oliver 1987c).

depuration $t_{1/2} = 158 \text{ d}$ for high-dose treatment, $t_{1/2} = 174 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.195 2,2',3,3',4,4',5,6-Octachlorobiphenyl (PCB-195)

Common Name: 2,2',3,3',4,4',5,6-Octachlorobiphenyl

Synonym: PCB-195, 2,2',3,3',4,4',5,6-octachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,4',5,6-Octachlorobiphenyl

CAS Registry No: 52663-78-2

Molecular Formula: $C_{12}H_2Cl_8$

Molecular Weight: 429.768

Melting Point ($^{\circ}C$):

176 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

351.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00334 (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

2.204×10^{-4} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

6.81×10^{-5} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

9.92×10^{-5} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

1.12×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

4.53×10^{-5} , 7.46×10^{-5} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

2.19×10^{-5} , 3.63×10^{-5} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -5244/(T/K) + 13.24$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

12.77 (calculated-P/C, Burkhard 1984)

1.115 (wetted-wall column-GC/ECD, Brunner et al. 1990)

12.01 (calculated-QSPR, Dunnivant et al. 1992)

14.13 ± 0.78 (gas stripping-GC/ECD, measured range $4-31^{\circ}C$, Bamford et al. 2000)

0.079, 0.485, 2.724, 14.13, 54.5 (4, 11, 18, 25, $31^{\circ}C$, gas stripping-GC, Bamford et al. 2000)

$\ln K_{AW} = 62.305 - 20086.6/(T/K)$; temp range $4-31^{\circ}C$ (gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(167.0/kJ \cdot mol^{-1})/RT] + (0.518/kJ \cdot mol^{-1} \cdot K^{-1})/R$; where $R = 8.314 J \cdot K^{-1} \cdot mol^{-1}$ and temp range: $4-31^{\circ}C$, (gas stripping-GC, Bamford et al. 2000)

15.1 (exptl. data, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 167 \pm 13 kJ/mol$, $\Delta S_H = 0.52 \pm 0.05 kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

7.49 (calculated-TSA, Burkhard 1984)

7.35 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.56 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

- 6.95 (generator column-GC, Larsen et al. 1992)
7.15 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 11.13, 10.04; 10.02 (0, 20°C, GC-k' correlation; calculated at 20°C, Zhang et al. 1999)
11.26 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 5.92; 7.45 (zebrafish: $\log BCF_w$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)

Sorption Partition Coefficient, $\log K_{OC}$:

- 7.29 (suspended particulate matter, Burkhard 1984)
5.78, 5.59, 5.55, 5.32 (marine humic substances, in concentrations. of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
5.78; 5.87 (marine humic substances with 5 mg/L DOC, reported as association coefficient $\log K_h$, observed; calculated-MCI χ , Sabljic et al. 1989)
6.42, 6.26, 6.14 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

- $k_1 = 5930 \text{ d}^{-1}$; $k_2 = 0.00711 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)
 $k_2 = 0.010 \text{ d}^{-1}$ with $t_{1/2} = 67 \text{ d}$ and $k_2 = 0.011 \text{ d}^{-1}$ with $t_{1/2} = 61 \text{ d}$ for food concn of 24 ng/g and 126 ng/g, respectively, in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)
 $k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 143 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 158 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 61\text{--}67 \text{ d}$ in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

depuration $t_{1/2} = 143 \text{ d}$ for high-dose treatment, $t_{1/2} = 158 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.196 2,2',3,3',4,4',5,6'-Octachlorobiphenyl (PCB-196)

Common Name: 2,2',3,3',4,4',5,6'-Octachlorobiphenyl

Synonym: PCB-196, 2,2',3,3',4,4',5,6'-octachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,4',5,6'-Octachlorobiphenyl

CAS Registry No: 42740-50-1

Molecular Formula: $C_{12}H_2Cl_8$

Molecular Weight: 429.768

Melting Point ($^{\circ}C$):

170 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

351.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2.91×10^{-3} (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

1.63×10^{-4} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

6.81×10^{-5} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

4.87×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

5.40×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

6.11×10^{-5} , 8.41×10^{-5} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

3.47×10^{-5} , 5.89×10^{-5} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -5244/(T/K) + 13.37$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

71.94 (calculated-P/C, Burkhard 1984)

1.013 (wetted wall column-GC/ECD, Brunner et al. 1990)

13.23 (calculated-QSPR, Dunnivant et al. 1992)

0.990 (calculated-QSPR, Achman et al. 1993)

15.1 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 167 \pm 13\ kJ/mol$, $\Delta S_H = 0.52 \pm 0.05\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.57 (calculated-TSA, Burkhard 1984)

7.43 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.65 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

7.43 (recommended, Sangster 1993)

7.70 (estimated, Girvin & Scott 1997)

7.4190 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

12.27, 11.03; 11.19 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
11.40 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

7.37 (suspended particulate matter, Burkhard 1984)
5.857 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)
7.30 (soil-organic carbon, calculated- K_{OW} , Girvin & Scott 1997)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 156 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 168 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

- 7.35 (suspended particulate matter, Burkhard 1984)
5.91, 5.63, 5.56, 5.23 (marine humic substances, in concentrations. of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
5.91; 5.86 (marine humic substances with 5 mg/L DOC, reported as association coefficient $\log K_h$, observed; calculated-MCI $^1\chi$, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 158 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 185 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 158 \text{ d}$ for high-dose treatment, $t_{1/2} = 185 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.199 2,2',3,3',4,5,5',6'-Octachlorobiphenyl (PCB-199)

Common Name: 2,2',3,3',4,5,5',6'-Octachlorobiphenyl

Synonym: PCB-199, 2,2',3,3',4,5,5',6'-octachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,5,5',6'-Octachlorobiphenyl

CAS Registry No: 52663-75-9

Molecular Formula: $C_{12}H_2Cl_8$

Molecular Weight: 429.768

Melting Point ($^{\circ}C$):

170 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

351.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

3.23×10^{-3} (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

3.41×10^{-4} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

5.41×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

3.20×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

3.57×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

9.35×10^{-5} , 1.67×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

1.05×10^{-4} , 2.04×10^{-4} (supercooled liquid P_L : GC-RI correlation, different stationary phases, reported as the revised order PCB-200-2,2',3,3',4,5,6,6'- Fischer et al. 1992)

$\log(P_L/Pa) = -5244/(T/K) + 13.36$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

42.66 (calculated-P/C, Burkhard 1984)

1.013 (wetted wall column-GC/ECD, Brunner et al. 1990)

23.0 (calculated-QSPR, Dunnivant et al. 1992)

15.1 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 167 \pm 13$ kJ/mol, $\Delta S_H = 0.52 \pm 0.05$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

7.51 (calculated-TSA, Burkhard 1984)

7.21 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.20 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

7.21 (recommended, Sangster 1993)

7.28 (quoted lit., Maruya & Lee 1998-reported as revised order PCB-200: 2,2',3,3',4,5,6,6'-PCB)

7.21 (revised previously quoted value; Maruya & Lee 2000)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

12.28, 11.05; 10.02 (0, 20°C, multi-column GC-k' correlation, Zhang et al. 1999)

11.01 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Biota Sediment Accumulation Factor, BSAF:

96 (trout in Lake Ontario, Niimi 1996)

0.26, 7.1, 1.1 (grass shrimp, striped mullet, sea trout muscle, Maruya & Lee 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

7.31 (suspended particulate matter, Burkhard 1984)

5.94, 5.72, 5.68, 5.36 (marine humic substances, in concentrations of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)

5.711 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

6.44, 6.18, 6.02 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

7.1.1.200 2,2',3,3',4,5,6,6'-Octachlorobiphenyl (PCB-200)

Common Name: 2,2',3,3',4,5,6,6'-Octachlorobiphenyl

Synonym: PCB-200, 2,2',3,3',4',5,6,6'-octachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,5,6,6'-Octachlorobiphenyl

CAS Registry No: 52663-73-7

Molecular Formula: $C_{12}H_2Cl_8$

Molecular Weight: 429.768

Melting Point ($^{\circ}C$):

130 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

351.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2.93×10^{-3} (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

4.105×10^{-4} , 1.79×10^{-4} , 1.08×10^{-4} , 2.01×10^{-4} (RP-HPLC- k' correlation, different and mobile stationary phases, Brodsky & Ballschmiter 1988)

4.30×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

4.56×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

6.37×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

1.75×10^{-4} , 3.32×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

3.89×10^{-5} , 5.89×10^{-5} (supercooled liquid P_L , GC-RI correlation, different stationary phases, reported in revised order as PCB-201-2,2',3,3',4,5',6,6'-, Fischer et al. 1992)

$\log(P_L/Pa) = -4851/(T/K) + 12.24$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

2.34×10^{-5} (P_L , calculated-MCI $^3\chi$ and Characteristic Root Index CRI, Saçan & Balcioglu 1998)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

66.98 (calculated-P/C, Burkhard 1984)

1.50 (calculated-QSPR, Achman et al. 1993)

24.36 (calculated-QSPR, Dunnivant et al. 1992)

97.5 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 145 \pm 7$ kJ/mol, $\Delta S_H = 0.46 \pm 0.04$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

7.57 (calculated-TSA, Burkhard 1984)

7.16, 7.54, 7.16, 7.36; 7.35 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

7.35 (recommended, Sangster 1993)

7.27 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

- 8.16; 7.27–7.30 (calculated-Characteristic Root Index CRI; min.-max. range, Saçan & Inel 1995)
7.63; 7.28 (previously quoted; revised value, Maruya & Lee 2000)
7.32 (calculated-QSPR, Yeh & Hong 2002- reported as PCB-201 for 2,2',3,3',4,5,6,6'-octachlorobiphenyl)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 12.05, 10.82 (0, 20°C, multi-column GC-k' correlation, Zhang et al. 1999)
11.05 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 7.36 (suspended particulate matter, Burkhard 1984)
5.50, 5.72, 5.68, 5.36 (marine humic substances, in concentrations. of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
5.68; 5.70 (marine humic substances with 5 mg/L DOC, reported as association coefficient $\log K_h$, observed; calculated-MCI χ , Sabljic et al. 1989)
7.05 (soil, calculated-Characteristic Root Index CRI, Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

7.1.1.201 2,2',3,3',4,5',6,6'-Octachlorobiphenyl (PCB-201)

Common Name: 2,2',3,3',4,5',6,6'-Octachlorobiphenyl

Synonym: PCB-201, 2,2',3,3',4,5',6,6'-octachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,5',6,6'-Octachlorobiphenyl

CAS Registry No: 40186-71-8

Molecular Formula: $C_{12}H_2Cl_8$

Molecular Weight: 429.768

Melting Point ($^{\circ}C$):

162 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

351.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

3.06×10^{-3} (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

2.204×10^{-4} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

8.58×10^{-5} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

4.56×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

5.06×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

5.94×10^{-5} , 1.0×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

1.41×10^{-4} (supercooled liquid P_L : GC-RI correlation, different stationary phases, reported as revised order PCB-199, 2,2',3,3',4,5',6,6'-octachlorobiphenyl, Fischer et al. 1992)

$\log(P_L/Pa) = -4581/(T/K) + 12.51$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

64.54 (calculated-P/C, Burkhard 1984)

1.72 (wetted wall column-GC/ECD, Brunner et al. 1990)

13.23 (calculated-QSPR, Dunnivant et al. 1992)

0.990 (calculated-QSPR, Achman et al. 1993)

0.156, 0.457 (0, $15^{\circ}C$, from modified two-film exchange model, Hornbuckle et al. 1994)

95.8 ± 4.4 (gas stripping-GC/ECD, measured range $4-31^{\circ}C$, Bamford et al. 2000)

1.069, 5.14, 22.98, 95.8, 308 (4, 11, 18, 25, $31^{\circ}C$, gas stripping-GC, Bamford et al. 2000)

$K_{AW} = \exp[-(144.5/kJ \cdot mol^{-1})/RT] + (0.458/kJ \cdot mol^{-1} \cdot K^{-1})/R$; where $R = 8.314 J \cdot K^{-1} \cdot mol^{-1}$ and temp range: $4-31^{\circ}C$, (gas stripping-GC, Bamford et al. 2000)

97.5 (exptl. data, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 145 \pm 7 kJ/mol$, $\Delta S_H = 0.46 \pm 0.03 kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.54 (calculated-TSA, Burkhard 1984)

7.35 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

- 7.21 (generator column-GC, Hawker & Connell 1988)
- 7.62 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)
- 7.80 (calculated-TSA, Murray & Andren 1992)
- 7.31 (recommended, Sangster 1993)
- 7.70 (estimated, Girvin & Scott 1997)
- 7.21 (quoted lit., Maruya & Lee 1998, reported as the revised order PCB-199, 2,2',3,3',4',5,5',6-octachlorobiphenyl)
- 7.62 (revised previously quoted value, Maruya & Lee 2000)
- 7.21; 7.32 (quoted exptl.-generator column method; calculated-QSPR, Yeh & Hong 2002, reported as PCB-201 for 2,2',3,3',4,5,6,6'-octachlorobiphenyl-should be PCB-200 in B&Z/IUPAC numbering system for 2,2',3,3',4,5,5',6-octachlorobiphenyl)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 12.22, 10.98 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
- 11.30 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 5.88; 7.41 (zebrafish: $\log BCF_w$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)

Sorption Partition Coefficient, $\log K_{OC}$:

- 7.34 (suspended particulate matter, Burkhard 1984)
- 5.913; 5.857 (marine humic substances with 5 mg/L DOC, reported as association coefficient $\log K_h$, observed; calculated-MCI χ , Sabljic et al. 1989)
- 6.60 (average, colloids and micro-particulates in precipitation events, GC/ECD, Murray & Andren 1992)
- 7.30 (soil, estimated- $\log K_{OW}$, Girvin & Scott 1997)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 5950 \text{ d}^{-1}$; $k_2 = 0.00776 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 153 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 172 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 153 \text{ d}$ for high-dose treatment, $t_{1/2} = 172 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.202 2,2',3,3',5,5',6,6'-Octachlorobiphenyl (PCB-202)

Common Name: 2,2',3,3',5,5',6,6'-Octachlorobiphenyl

Synonym: PCB-202, 2,2',3,3',5,5',6,6'-octachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',5,5',6,6'-Octachlorobiphenyl

CAS Registry No: 2136-99-4

Molecular Formula: $C_{12}H_2Cl_8$

Molecular Weight: 429.768

Melting Point ($^{\circ}C$):

161 (Van Roosmalen 1934; Burkhard et al. 1985a; Erickson 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.507

Molar Volume (cm^3/mol):

351.8 (calculated-Le Bas method at normal boiling point)

263.2 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

22.80 (Miller et al. 1984; Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

52.72 (Miller et al. 1984; Shiu & Mackay 1986; selected, Hinckley et al. 1990)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0463 (mp at $161^{\circ}C$)

0.0443 (Mackay et al. 1980; Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1.80×10^{-4} (generator column-GC/ECD, Weil et al. 1974;)

3.93×10^{-4} (generator column-GC/ECD, Miller et al. 1984,1985)

1.47×10^{-4} * (generator column-GC/ECD, measured range 20 – $50^{\circ}C$, Dickhut et al. 1986)

1.14×10^{-4} , 1.47×10^{-4} , 2.12×10^{-4} , 4.66×10^{-4} (4. 20, 25, $32^{\circ}C$, generator column-GC/ECD, Dickhut et al. 1986)

$\ln x = -6098/(T/K) - 5.333$, temp range 4 – $32^{\circ}C$, $\Delta H_{ss} = 50.7$ kJ/mol (generator column-GC/ECD, Dickhut et al. 1986)

$\log x = -2652/(T/K) - 2.308$, $\Delta H_{ss} = 50.6$ kJ/mol (regression eq. given by Doucette & Andren 1988, based on exptl data of Dickhut et al. 1986); or

$S/(mol/L) = 6.91 \times 10^{-11} \exp(0.064 \cdot t/^{\circ}C)$ (regression eq. given by Doucette & Andren 1988, based on exptl data of Dickhut et al. 1986)

2.53×10^{-4} , 5.93×10^{-4} , 6.51×10^{-4} , 2.36×10^{-4} (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

$\ln x = -5.34 - 6100/(T/K)$, temp range 5 – $50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2.90×10^{-5} * (extrapolated gas saturation-GC, measured range 29 – $61.2^{\circ}C$, Burkhard et al. 1984)

$\log (P/Pa) = 13.262 - 5307.3/(T/K)$; temp range 29 – $61.2^{\circ}C$ (gas saturation data, Clapeyron eq., Burkhard et al. 1984)

2.89×10^{-5} , 6.43×10^{-4} (solid P_s , P_L calculated from P_s using fugacity ratio F, Burkhard et al. 1985a)

5.40×10^{-4} (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

1.70×10^{-4} , 3.91×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

6.59×10^{-4} , 5.26×10^{-4} (supercooled P_L , converted from literature P_s with different ΔS_{fus} values, Hinckley et al. 1990)

2.22×10^{-4} (P_{GC} by GC-RT correlation with p,p' -DDT as reference standard, Hinckley et al. 1990)

$\log P_L/Pa = 12.99 - 4851/(T/K)$ (GC-RT correlation, Hinckley et al. 1990)
 2.40×10^{-4} (supercooled liquid P_L : GC-RI correlation, Fischer et al. 1992)
 $\log (P_L/Pa) = -4851/(T/K) + 12.99$ (supercooled liquid, GC-RT correlation, Falconer & Bidleman 1994)
 $(2.41 - 29.5) \times 10^{-6}$; $(1.73 - 5.40) \times 10^{-4}$ (literature solid P_s range; literature liquid P_L range, Delle Site 1997)
 $\log (P/Pa) = 13.282 - 5307.3/(T/K)$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

Henry's Law Constant ($Pa\ m^3/mol$ at 25°C):

75.79 (calculated-P/C, Burkhard et al. 1985b)
 38.08 (calculated-P/C, Shiu & Mackay 1986)
 1.82 (wetted-wall column-GC, Brunner et al. 1990)
 22.63 (calculated-QSPR, Dunnivant et al. 1992)
 1.50 (calculated-QSPR, Achman et al. 1993)
 97.5 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 145 \pm 7\ kJ/mol$, $\Delta S_H = 0.46 \pm 0.03\ kJ/mol\cdot K$
 (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

9.77 (Hansch & Leo 1979)
 8.42 (TLC-RT correlation, Bruggeman et al. 1982)
 7.11 (generator column-GC/ECD, Miller et al. 1984, 1985)
 7.14 (generator column-HPLC, Woodburn et al. 1984)
 7.12 (generator column-GC/ECD, Doucette & Andren 1987, 1988)
 7.01, 7.35, 6.98, 7.31 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 7.21 (generator column-GC, Hawker & Connell 1988a)
 7.67 (HPLC-RT correlation, Hawker & Connell 1988)
 7.729 ± 0.031 (shake flask/slow stirring-GC/ECD, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
 7.54 (HPLC- k' correlation, Noegrohati & Hammers 1992)
 7.15 (recommended, Sangster 1993)
 7.73 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

11.57, 10.38 (0, 20°C, multi-column GC- k' correlation; calculated at 20°C, Zhang et al. 1999)
 10.77 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

5.82; 7.35 (22°C, zebrafish: $\log BCF_w$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)
 5.82, 7.35 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

7.34 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 5.61, 5.46, 5.41, 4.99 (marine humic substances, in concentrations of 5, 10, 20, 40 mg/L DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
 5.610, 5.699 (marine humic substances with 5 mg/L of DOC, reported as association coefficient $\log K_h$, observed; calculated-MCI χ , Sabljic et al. 1989)
 6.36, 6.13, 6.01 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)
 7.04 (soil, calculated-Characteristic Root Index [CRI], Saçan & Balcioglu 1996)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 5070 \text{ d}^{-1}$; $k_2 = 0.0077 \text{ d}^{-1}$ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)

$k_2 = 0.006 \text{ d}^{-1}$ with $t_{1/2} = 119 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 145 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 110 \text{ d}$ for high-dose treatment, $t_{1/2} = 145 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

TABLE 7.1.1.202.1

Reported aqueous solubilities and vapor pressures of 2,2',3,3',5,5',6,6'-octachlorobiphenyl (PCB-202) at various temperatures and the reported empirical temperature dependence equations

Aqueous solubility		Vapor pressure	
Dickhut et al. 1986		Burkhard et al. 1984	
generator column-GC/ECD		gas saturation-GC/ECD	
t/°C	S/g·m ⁻³	t/°C	P/Pa
20	1.29×10^{-4}	29.0	4.95×10^{-5}
25	1.29×10^{-4}	39.9	2.24×10^{-4}
32	2.15×10^{-4}	50.0	5.83×10^{-4}
50	7.73×10^{-4}	61.2	2.65×10^{-3}
		25.0	2.90×10^{-5}
$\ln x = A - B/(T/K)$		$\log (P/\text{Pa}) = A - B/(T/K)$	
A	-5.333	A	13.262
B	6098.15	B	5307.3
$\Delta H_{\text{sol}}/(\text{kJ mol}^{-1}) = 50.7 \pm 3.8$ for 25–50°C		temp range 29–61.2°C	
		$\Delta H_{\text{subl}}/(\text{kJ mol}^{-1}) = 101.7$	

FIGURE 7.1.1.202.1 Logarithm of mole fraction solubility and vapor pressure versus reciprocal temperature for 2,2',3,3',5,5',6,6'-octachlorobiphenyl (PCB-202).

7.1.1.203 2,2',3,4,4',5,5',6-Octachlorobiphenyl (PCB-203)

Common Name: 2,2',3,4,4',5,5',6-Octachlorobiphenyl

Synonym: PCB-203, 2,2',3,4,4',5,5',6-octachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,4',5,5',6-Octachlorobiphenyl

CAS Registry No: 52663-76-0

Molecular Formula: $C_{12}H_2Cl_8$

Molecular Weight: 429.768

Melting Point ($^{\circ}C$):

170 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

351.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2.91×10^{-3} (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

1.36×10^{-4} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

6.81×10^{-5} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence):

1.35×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

1.52×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

9.29×10^{-5} , 1.047×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

3.47×10^{-5} , 5.62×10^{-5} (supercooled liquid P_L , GC-RI correlation, different stationary phases, Fischer et al. 1992)

$\log(P_L/Pa) = -5244/(T/K) + 13.39$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.252 (calculated-P/C, Burkhard 1984)

14.21 (calculated-QSPR, Dunnivant et al. 1992)

0.990 (calculated-QSPR, Achman et al. 1993)

15.1 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 167 \pm 13$ kJ/mol, $\Delta S_H = 0.52 \pm 0.05$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.57 (calculated-TSA, Burkhard 1984)

7.49 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

7.65 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

6.93 (generator column-GC, Larsen et al. 1992)

7.21 (recommended, Sangster 1993)

7.4825 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated :

12.36, 11.10 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)

11.24 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

7.37 (suspended particulate matter, Burkhard 1984)

5.857 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

7.1.1.204 2,2',3,4,4',5,6,6'-Octachlorobiphenyl (PCB-204)

Common Name: 2,2',3,4,4',5,6,6'-Octachlorobiphenyl

Synonym: PCB-204, 2,2',3,4,4',5,6,6'-octachloro-1,1'-biphenyl

Chemical Name: 2,2',3,4,4',5,6,6'-Octachlorobiphenyl

CAS Registry No: 74472-52-9

Molecular Formula: $C_{12}H_2Cl_8$

Molecular Weight: 429.768

Melting Point ($^{\circ}C$):

132 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

351.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2.81×10^{-3} (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

1.49×10^{-4} , 9.85×10^{-5} , 1.83×10^{-4} , 1.49×10^{-4} (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

4.30×10^{-4} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

3.49×10^{-4} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

3.88×10^{-4} (GC-RI correlation, Burkhard et al. 1985b)

1.54×10^{-4} , 2.76×10^{-4} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

1.38×10^{-4} (supercooled liquid P_L , GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -4851/(T/K) + 12.46$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

53.3 (calculated-P/C, Burkhard 1984)

34.89 (calculated-QSAR, Dunnivant et al. 1992)

97.5 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 145 \pm 7$ kJ/mol, $\Delta S_H = 0.46 \pm 0.04$ kJ/mol-K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{ow}$:

7.59 (calculated-TSA, Burkhard 1984)

7.46, 7.63, 7.37, 7.45 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

7.30 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

7.48 (recommended, Sangster 1993)

7.2632 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$:

11.15 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

7.39 (suspended particulate matter, Burkhard 1984)

5.699 (marine humic substances 5 mg/L of DOC, reported as association coefficient log K_h , calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

7.1.1.205 2,3,3',4,4',5,5',6-Octachlorobiphenyl (PCB-205)

Common Name: 2,3,3',4,4',5,5',6-Octachlorobiphenyl

Synonym: PCB-205, 2,3,3',4,4',5,5',6-octachloro-1,1'-biphenyl

Chemical Name: 2,3,3',4,4',5,5',6-Octachlorobiphenyl

CAS Registry No: 74472-53-0

Molecular Formula: $C_{12}H_2Cl_8$

Molecular Weight: 429.768

Melting Point ($^{\circ}C$):

150 (estimated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

351.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

3.50×10^{-3} (S_L supercooled liquid, calculated-TSA, Burkhard et al. 1985a)

8.58×10^{-5} (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

3.41×10^{-5} (calculated-TSA and mp, Abramowitz & Yalkowsky 1990)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

3.84×10^{-5} (P_L supercooled liquid, GC-RT correlation, Burkhard et al. 1985a)

4.40×10^{-5} (GC-RI correlation, Burkhard et al. 1985b)

2.49×10^{-5} , 2.91×10^{-5} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -5402/(T/K) + 13.51$ (GC-RT correlation, supercooled liquid, Falconer & Bidleman 1994)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

4.70 (calculated-P/C, Burkhard 1984)

8.644 (calculated-QSPR, Dunnivant et al. 1992)

10.9 (predicted based on homolog group and ortho-Cl, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 169 \pm 6\ kJ/mol$, $\Delta S_H = 0.52 \pm 0.05\ kJ/mol \cdot K$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.47 (calculated-TSA, Burkhard 1984)

7.62 (RP-HPLC- k' correlation, Brodsky & Ballschmiter 1988)

8.00 (calculated-TSA, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

7.62 (recommended, Sangster 1993)

7.7326 (calculated-molecular properties MNDO-AM1 method, Makino 1998)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated:

12.86, 11.62 (0, $20^{\circ}C$, multi-column GC- k' correlation, Zhang et al. 1999)

11.34 (calculated-QSPR-quantum chemical descriptors by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 7.27 (suspended particulate matter, Burkhard 1984)
6.016 (marine humic substances with 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices, Sabljic et al. 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Photooxidation:

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 166 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 168 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Ground water:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 166 \text{ d}$ for high-dose treatment, $t_{1/2} = 168 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.206 2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl (PCB-206)

Common Name: 2,2',3,3',4,4',5,5',6-Nonachlorobiphenyl

Synonym: PCB-206, 2,2',3,3',4,4',5,5',6-nonachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,4',5,5',6-nonachlorobiphenyl

CAS Registry No: 40186-72-9

Molecular Formula: $C_{12}HCl_9$

Molecular Weight: 464.213

Melting Point ($^{\circ}C$):

204.5–206.5 (Hutzinger et al. 1974)

Boiling Point ($^{\circ}C$):

Density (g/cm^3 at $20^{\circ}C$): 1.507

Molar Volume (cm^3/mol):

372.7 (calculated-Le Bas method at normal boiling point)

276.1 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

28.70 (Opperhuizen et al. 1988; Ruelle et al. 1993)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.016 (Mackay et al. 1980; Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.000112 (generator column-GC/ECD, Weil et al. 1974)

2.55×10^{-5} (generator column-GC/ECD, measured range 25 – $50^{\circ}C$, Dickhut et al. 1986)

2.55×10^{-5} , 5.117×10^{-5} , 6.59×10^{-5} , 1.32×10^{-4} (25 , 32 , 40 , $50^{\circ}C$, generator column-GC/ECD, Dickhut et al. 1986)

$\ln x = -5990/(T/K) - 7.427$, temp range 25 – $50^{\circ}C$, $\Delta H_{ss} = 49.8$ kJ/mol (generator column-GC/ECD, Dickhut et al. 1986)

$\log x = -2609/(T/K) - 3.222$, $\Delta H_{ss} = 50.0$ kJ/mol (regression eq. given by Doucette & Andren 1988, based on exptl data of Dickhut et al. 1986); or

$S/(mol/L) = 1.27 \times 10^{-11} \exp(0.062 \cdot t/^{\circ}C)$ (regression eq. given by Doucette & Andren 1988, based on exptl data of Dickhut et al. 1986)

0.00011 (selected, Shiu & Mackay 1986)

3.07×10^{-5} , 3.14×10^{-5} , 2.61×10^{-5} , 2.80×10^{-5} (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

7.80×10^{-5} ($22^{\circ}C$, generator column-GC/ECD, Opperhuizen et al. 1988)

$\ln x = -7.4275 - 6004.5/(T/K)$, temp range 5 – $50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.88×10^{-6} (GC-RI correlation, Burkhard et al. 1985a)

1.034×10^{-4} (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

1.08×10^{-5} , 1.53×10^{-5} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log (P_L/Pa) = -5226/(T/K) + 13.57$ (supercooled liquid, GC-RT correlation, Falconer & Bidleman 1994)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

27.66 (calculated-P/C, Burkhard et al. 1985b)

8.845 (calculated-QSPR, Dunnivant et al. 1992)

0.474 (calculated-QSPR, Achman et al. 1993)

- 15.1 (estimated based on homolog group and ortho chlorine number, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 167 \pm 13$ kJ/mol, $\Delta S_H = 0.52 \pm 0.05$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 9.14 (RP-TLC- k' correlation, Bruggeman et al. 1982)
 7.94, 7.91, 7.98, 7.94 (RP- HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 7.07 (generator column-GC, Larsen et al. 1992)
 7.51 (recommended, Sangster 1993)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 13.09, 11.79 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
 11.81 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 5.71; 7.24 (zebrafish: $\log BCF_W$ wet wt basis; $\log BCF_L$ lipid wt basis, Fox et al. 1994)
 2.60–4.85 (various marine species, mean dry weight BCF, Hope et al. 1998)
 4.37–5.67 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

- 7.72 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
 6.15, 5.92, 5.83, 5.69 (marine humic substances, in concentrations of 5, 10, 20, 40 mg L⁻¹ DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)
 6.152; 6.133 (marine humic substances of 5 mg L⁻¹ DOC, quoted; calculated-MCI χ , reported as $\log K_h$, Sabljic et al. 1989)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_2 > 0.0007$ d⁻¹ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)
 $k_1 = 4940$ d⁻¹; $k_2 = 0.00958$ d⁻¹ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)
 $k_2 = 0.016$ d⁻¹ with $t_{1/2} = 45$ d and $k_2 = 0.013$ d⁻¹ with $t_{1/2} = 53$ d for food concn of 20 ng/g and 141 ng/g, respectively, in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)
 $k_2 = 0.005$ d⁻¹ with $t_{1/2} = 140$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 $k_2 = 0.005$ d⁻¹ with $t_{1/2} = 148$ d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil:

Biota: $t_{1/2} > 1000$ d in rainbow trout, and $t_{1/2} = 84$ d in its muscle (Niimi & Oliver 1983)

Depuration $t_{1/2} = 45$ –53 d in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)

depuration $t_{1/2} = 140$ d for high-dose treatment, $t_{1/2} = 148$ d for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.207 2,2',3,3',4,4',5,6,6'-Nonachlorobiphenyl (PCB-207)

Common Name: 2,2',3,3',4,4',5,6,6'-Nonachlorobiphenyl

Synonym: PCB-207, 2,2',3,3',4,4',5,6,6'-nonachloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,4',5,6,6'-nonachlorobiphenyl

CAS Registry No: 52663-79-3

Molecular Formula: $C_{12}HCl_9$

Molecular Weight: 464.213

Melting Point ($^{\circ}C$):

161 (calculated, Abramowitz & Yalkowsky 1990)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

372.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00167 (supercooled liquid S_L , calculated-TSA, Burkhard et al. 1985b)

4.64×10^{-5} , 3.29×10^{-5} , 4.04×10^{-5} , 3.77×10^{-5} (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

0.000058 (calculated-TSA, Abramowitz & Yalkowsky 1990)

2.10×10^{-5} (calculated-MCI χ , Patil 1991)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.47×10^{-4} (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985a)

1.30×10^{-4} (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

3.17×10^{-5} , 4.99×10^{-5} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

$\log(P_L/Pa) = -5127/(T/K) + 12.70$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

35.97 (calculated-P/C, Burkhard et al. 1985b)

17.13 (calculated-QSPR, Dunnivant et al. 1992)

0.717 (calculated-QSPR, Achman et al. 1993)

97.5 (estimated based on homolog group and ortho chlorine number, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 145 \pm 7$ kJ/mol, $\Delta S_H = 0.46 \pm 0.04$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.94 (calculated-TSA, Burkhard 1984)

7.84, 7.97, 7.85, 7.86 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

7.52 (generator column-GC, Hawker & Connell 1988a; quoted, Hansch et al. 1995)

7.74 (calculated-TSA, Hawker & Connell 1988a)

7.80 (calculated-MCI χ , Patil 1991)

7.88 (recommended, Sangster 1993)

7.6190 (calculated-molecular properties MNDO-AM1, Makino 1998)

7.77 (calculated-QSPR, Yeh & Hong 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

12.60, 11.26 (0, 20°C, multi-column GC-k' correlation, Zhang et al. 1999)

11.94 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

2.65–4.54 (various marine species, mean dry wt. BCF, Hope et al. 1998)

4.02–6.29 (various marine species, mean lipid-normalized BCF, Hope et al. 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

7.74 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)

5.98, 5.77, 5.67, 5.44 (marine humic substances, in concentrations of 5, 10, 20, 40 mg L⁻¹ DOC, reported as association coefficient $\log K_h$, Lara & Ernst 1989)

5.98, 5.97 (marine humic substances of 5 mg L⁻¹ DOC, quoted; calculated-MCI χ , reported as $\log K_h$, Sabljic et al. 1989)

6.39, 6.17, 6.19 (North Sea sediments, batch equilibrium, Lara & Ernst 1990)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 162 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.004 \text{ d}^{-1}$ with $t_{1/2} = 155 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 162 \text{ d}$ for high-dose treatment, $t_{1/2} = 155 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.208 2,2',3,3',4,5,5',6,6'-Nonachlorobiphenyl (PCB-208)

Common Name: 2,2',3,3',4,5,5',6,6'-Nonachlorobiphenyl

Synonym: PCB-208, 2,2',3,3',4,5,5',6,6'-nonochloro-1,1'-biphenyl

Chemical Name: 2,2',3,3',4,5,5',6,6'-nonachlorobiphenyl

CAS Registry No: 52663-77-1

Molecular Formula: $C_{12}HCl_9$

Molecular Weight: 464.213

Melting Point ($^{\circ}C$):

180.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

372.7 (calculated-Le Bas method at normal boiling point)

276.1 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

22.60 (Ruelle et al. 1993; Ruelle & Kesselring 1997; Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

49.45 (Shiu & Mackay 1986)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0298 (mp at $180.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.80×10^{-5} (generator column-GC/ECD, Miller et al. 1984,1985)

6.87×10^{-5} ; 4.64×10^{-5} , 6.87×10^{-5} , 3.95×10^{-5} , 4.97×10^{-5} (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

1.74×10^{-7} (calculated-UNIFAC activity coefficients, Banerjee & Howard 1988)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

3.78×10^{-6} (GC-RI correlation, Burkhard et al. 1985a)

1.22×10^{-4} (supercooled liquid P_L , GC-RI correlation, Burkhard et al. 1985b)

3.08×10^{-5} , 6.62×10^{-5} (supercooled liquid P_L , GC-RT correlation, different stationary phases, Foreman & Bidleman 1985)

2.19×10^{-5} (supercooled liquid P_L ; GC-RI correlation, Fischer et al. 1992)

$\log(P_L/Pa) = -5127/(T/K) + 12.68$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

32.53 (calculated-P/C, Burkhard et al. 1985b)

16.93 (calculated-QSPR, Dunnivant et al. 1992)

97.5 (estimated based on homolog group and ortho chlorine number, Bamford et al. 2002)

$\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 145 \pm 7$ kJ/mol, $\Delta S_H = 0.46 \pm 0.04$ kJ/mol·K (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.92 (calculated-TSA, Burkhard 1984)

8.16 (generator column-GC/ECD, Miller et al. 1984,1985)

9.05 (calculated-UNIFAC activity coeff., Banerjee & Howard 1988)

7.72, 7.87, 7.69, 7.78 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)

8.18 (calculated-TSA, Hawker & Connell 1988a)

- 7.77 (recommended, Sangster 1993)
8.16 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 12.57, 11.26 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
11.71 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

- 7.72 (suspended particulate matter, calculated- K_{OW} , Burkhard 1984)
5.974 (marine humic substances 5 mg/L of DOC, reported as association coefficient $\log K_h$, calculated-molecular connectivity indices χ , Sabljic et al. 1989)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 139 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)

$k_2 = 0.005 \text{ d}^{-1}$ with $t_{1/2} = 152 \text{ d}$ (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil:

Biota: depuration $t_{1/2} = 139 \text{ d}$ for high-dose treatment, $t_{1/2} = 152 \text{ d}$ for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

7.1.1.209 2,2',3,3',4,4',5,5',6,6'-Decachlorobiphenyl (PCB-209)

Common Name: 2,2',3,3',4,4',5,5',6,6'-Decachlorobiphenyl

Synonym: PCB-209

Chemical Name: 2,2',3,3',4,4',5,5',6,6'-decachlorobiphenyl

CAS Registry No: 2051-24-3

Molecular Formula: $C_{12}Cl_{10}$

Molecular Weight: 498.658

Melting Point ($^{\circ}C$):

309 (Lide 2003)

Boiling Point ($^{\circ}C$):Density (g/cm^3 at $20^{\circ}C$): 1.507Molar Volume (cm^3/mol):

 9.44×10^{-6} (GC-RT correlation, Watanabe & Tatsukawa 1989)
 5.14×10^{-6} , 1.44×10^{-5} (supercooled P_L , converted from literature P_S with different ΔS_{fus} values, Hinckley et al. 1990)
 1.303×10^{-5} (P_{GC} by GC-RT correlation with p,p' -DDT as reference standard, Hinckley et al. 1990)
 $\log (P_L/\text{Pa}) = 13.27 - 5402/(T/K)$ (supercooled liquid, GC-RT correlation, Hinckley et al. 1990)
 $\log (P_L/\text{Pa}) = -5402/(T/K) + 13.27$ (supercooled liquid P_L , GC-RT correlation, Falconer & Bidleman 1994)
 $2.89 \times 10^{-9} - 1.40 \times 10^{-5}$; $(5.58-27.5) \times 10^{-6}$ (literature P_S range; P_L range, Delle Site 1997)
 2.6×10^{-5} * (65°C, Knudsen effusion, measured range 65–85°C, Goodman 1997)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

100 (estimated, Mackay et al. 1983)
 12.46 (calculated-P/C, Burkhard et al. 1985b)
 20.84 (calculated-P/C, Shiu & Mackay 1986; Shiu et al. 1987)
 40.0 (calculated-QSPR, Dunnivant et al. 1992)
 97.5 (estimated based on homolog group and ortho chlorine number, Bamford et al. 2002)
 $\ln K_{AW} = -\Delta H_H/RT + \Delta S_H/R$; R is the ideal gas constant, $\Delta H_H = 145 \pm 7 \text{ kJ/mol}$, $\Delta S_H = 0.46 \pm 0.04 \text{ kJ/mol-K}$ (Bamford et al. 2002)—see Comment by Goss et al. 2004

Octanol/Water Partition Coefficient, $\log K_{OW}$:

11.19 (Hansch & Leo 1979)
 9.60 (TLC-RT correlation, Bruggeman et al. 1982; 1984)
 8.26 (generator column-GC/ECD, Miller et al. 1984, 1985)
 8.20 (generator column-HPLC, Woodburn et al. 1984)
 8.20 (shake flask/slow stirring-GC, Brooke et al. 1986)
 8.20 (generator column-GC/ECD, Doucette & Andren 1987, 1988)
 8.38, 8.37, 8.41, 8.28 (RP-HPLC- k' correlation, different stationary and mobile phases, Brodsky & Ballschmiter 1988)
 9.45, 11.2 (calculated-UNIFAC activity coeff., π const. or f const., Banerjee & Howard 1988)
 8.274 ± 0.001 (shake flask/slow stirring-GC/ECD, De Bruijn et al. 1989; De Bruijn & Hermens 1990)
 > 9.0 (reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)
 8.24 (HPLC-retention indices correlation, Noegrohati & Hammers 1992)
 8.27 (recommended, Hansch et al. 1995)
 7.95 ± 0.68 (flask/slow stirring-SPME/GC, Paschke et al. 1998)
 7.59 (shake flask/slow stirring-GC/ECD, both phases, Fisk et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

13.36, 1.96 (0, 20°C, multi-column GC- k' correlation, Zhang et al. 1999)
 12.29 (calculated-QSPR-quantum chemical descriptor by PM3 Hamiltonian, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ at 25°C or as indicated:

5.48 (guppy, 3.5% extractable lipid, Bruggeman et al. 1984; quoted, Gobas et al. 1987)
 7.0 (fish, quoted, Mackay 1986; Metcalfe et al. 1988)
 1.48, 1.41 (human fat of lipid basis, calculated- K_{OW} , Geyer et al. 1987)
 1.38, 1.32 (human fat of wet wt. basis, calculated- K_{OW} , Geyer et al. 1987)
 4.02 (guppy, Gobas et al. 1987; quoted, Banerjee & Baughman 1991)
 4.02 (guppy, calculated- C_B/C_W or k_1/k_2 , Connell & Hawker 1988; Hawker 1990)

- 5.07 (guppy, estimated, Banerjee & Baughman 1991)
 5.44; 6.97 (22°C, zebrafish: log BCF_w wet wt basis; log BCF_L lipid wt basis, Fox et al. 1994)
 2.65–4.54 (various marine species, mean dry wt. BCF, Hope et al. 1998)
 > 5.44, > 6.97 (zebrafish: wet wt basis, lipid wt basis, Geyer et al. 2000)
 > 5.53, > 6.99 (guppy: wet wt basis, lipid wt basis, Geyer et al. 2000)
 6.95, 8.26 (fish 5% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)
 3.32, 3.97 (human, steady-state not reached during whole life: wet wt basis, lipid wt basis, Geyer et al. 2000)

Biota Sediment Accumulation Factor, BSAF:

- 13 (trout in Lake Ontario, Niimi 1996)
 0.047, 0.42, 0.10 (grass shrimp, striped mullet, sea trout muscle, Maruya & Lee 1998)

Sorption Partition Coefficient, log K_{OC}:

- 8.09 (suspended particulate matter, calculated-K_{OW}, Burkhard 1984)
 6.19, 5.99, 5.83, 5.61 (marine humic substances, in concentrations. of 5, 10, 20, 40 mg/L DOC, reported as association coefficient log K_h, Lara & Ernst 1989)
 6.19, 6.17 (marine humic substances of 5 mg L⁻¹ DOC, quoted; calculated-MCI χ , reported as log K_h, Sabljic et al. 1989)

Environmental Fate Rate Constants, k, or Half-Lives, t_{1/2}:

Volatilization/Evaporation: 8.5×10^{-7} g m⁻¹ h⁻¹ (Mackay 1986; Metcalfe et al. 1988).

Photolysis:

Hydrolysis:

Oxidation:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k₁) and Elimination (k₂) Rate Constants:

- k₂ > 0.0007 d⁻¹ (rainbow trout, Niimi & Oliver 1983; quoted, Clark et al. 1990)
 k₁ = 40 d⁻¹; k₂ = 0.004 d⁻¹ (guppy, Bruggeman et al. 1984)
 k₁ = 600 d⁻¹ (guppy, Opperhuizen 1986)
 log k₁ = 1.60 d⁻¹; log 1/k₂ = 2.39 d (fish, quoted, Connell & Hawker 1988)
 k₁ = 3640 d⁻¹; k₂ = 0.0132 d⁻¹ (22°C, zebrafish, 30-d exposure, Fox et al. 1994)
 k₂ = 0.013 d⁻¹ with t_{1/2} = 52 d and k₂ = 0.013 d⁻¹ with t_{1/2} = 52 d for food concn of 62 ng/g and 688 ng/g, respectively, in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)
 k₂ = 0.005 d⁻¹ with t_{1/2} = 127 d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose treatment, Buckman et al. 2004)
 k₂ = 0.005 d⁻¹ with t_{1/2} = 149 d (8°C, juvenile rainbow trout, 30-d uptake followed by 160-d depuration expt.- high-dose + CYPIA-inducing compounds (hCYP) treatment, Buckman et al. 2004)

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil:

- Biota: t_{1/2} > 1000 d in rainbow trout, and t_{1/2} = 122 d its muscle (Niimi & Oliver 1983);
 t_{1/2} = 175 d in guppy (Bruggeman et al. 1984).
 Depuration t_{1/2} = 52 d in a 30-d dietary exposure followed by 160-d depuration studies (juvenile rainbow trout, Fisk et al. 1998)
 depuration t_{1/2} = 127 d for high-dose treatment, t_{1/2} = 149 d for high-dose + enzyme CYPIA-inducing compounds (hCYP) treatment (8°C, juvenile rainbow trout, Buckman et al. 2004)

Reported aqueous solubilities and vapor pressures of decachlorobiphenyl at various temperatures and the reported empirical temperature dependence equations

7.1.2 ISOMER GROUPS

7.1.2.1 Monochlorobiphenyl

Common Name: Monochlorobiphenyl

Synonym: Dowtherm G

Chemical Name: monochlorobiphenyl

CAS Registry No: 27323-18-8

Molecular Formula: $C_{12}H_9Cl$

No. of Isomers: 3

Molecular Weight: 188.652

Melting Point ($^{\circ}C$):

25–77.9 (Shiu et al. 1987)

Boiling Point ($^{\circ}C$): 285

Chlorine Content: 18.79% (Hutzinger et al. 1974)

Density (g/cm^3): 1.1

Molar Volume (cm^3/mol):

205.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.30–1.0 (Mackay et al. 1983)

0.301–1.0 (Shiu et al. 1987)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.06–1.5 (selected, Mackay et al. 1983)

7.20 (selected, supercooled liq., Mackay et al. 1983a)

0.795–6.17, 4.08(exptl. range, calculated-UNIFAC, converted from $\log \gamma$, Burkhard et al. 1986)

1.2–5.5 (selected, Shiu et al. 1987)

2.5–6.73 (selected, supercooled liquid, Shiu et al. 1987)

1.2–9.5 (selected, Formica et al. 1988)

4.0 (selected, Metcalfe et al. 1988)

1.2–5.5 (quoted range of individual congeners, Luthy et al. 1997)

Vapor Pressure (Pa at $25^{\circ}C$):

1.1–5.6 (selected, Mackay et al. 1983a)

2.30 (supercooled liquid P_L , Mackay et al. 1983a)

1.32 (selected, supercooled liq., Bopp 1983)

1.10 (average, liquid, Mackay 1986; Metcalfe et al. 1988)

0.271–2.04 (selected, solid, Shiu et al. 1987)

0.9–2.5 (selected, supercooled liquid, Shiu et al. 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

79.3 (calculated-P/C, Bopp 1983)

58–74 (calculated, Mackay et al. 1983a)

60.0 (selected, Mackay et al. 1983a,b)

42.56–75.55 (calculated, Shiu et al. 1987)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.66 (selected, Mackay et al. 1983b)

4.70 (selected, Mackay 1986; Metcalfe et al. 1988)

4.3–4.6 (selected, Shiu et al. 1987)

4.73 (calculated-no. Cl atoms, Formica et al. 1988)

4.50 (quoted, Luthy et al. 1997)

Bioconcentration Factor, log BCF:

3.40 (fish, selected, Mackay 1986; Metcalfe et al. 1988)

Sorption Partition Coefficient, log K_{OC} :

Half-Lives in the Environment:

Air: atmospheric photodegradation, 0.62–1.4 d (Dilling et al. 1983); calculated tropospheric lifetime of 5–11 d due to calculated rate constant of gas-phase reaction with OH radicals for mono-chlorobiphenyls (Atkinson 1987); the tropospheric lifetime of 2.7–5.1 d based on the experimentally determined rate constant for gas-phase reaction with OH radicals for monochlorobiphenyls (Kwok et al. 1995).

Surface water: 1.4–4.9 d in Lake Michigan (Neely 1983); 2–3 d for river water (Bailey et al. 1983).

Groundwater:

Sediment:

Soil:

Biota:

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization/Evaporation: $k = 0.25 \text{ g/m}^2 \text{ h}$ (Mackay 1986; Metcalfe et al. 1988).

Photolysis: $t_{1/2} = 0.62\text{--}1.4 \text{ d}$ for photodegradation in the atmosphere (Dilling et al. 1983).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{exptl}) = (2.8 - 5.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = (3.1 - 4.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp., and the tropospheric lifetime was calculated to be 5–11 d for monochlorobiphenyls (Atkinson 1987)

$k_{OH}(\text{exptl}) = (2.8 - 5.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $k_{OH}(\text{calc}) = (3.2 - 4.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. for reaction with monochlorobiphenyls, the tropospheric lifetime was calculated to be 2.7–5.1 d (Kwok et al. 1995)

Hydrolysis:

Biodegradation: rate of degradation using species of *Alcaligenes* and *Acinetobacter*, $7 \times 10^{-8} \text{ nmol cell}^{-1} \cdot \text{h}^{-1}$ (Furukawa et al. 1978; selected, NAS 1979); time for 50% biodegradation of an initial concentration of 1–100 $\mu\text{g/L}$ by river dieaway test is about 2–5 d (Bailey et al. 1983).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

7.1.2.2 Dichlorobiphenyl

Common Name: Dichlorobiphenyl

Synonym:

Chemical Name: dichlorobiphenyl

CAS Registry No: 25512-42-9

Molecular Formula: $C_{12}H_8Cl_2$

No. of Isomers: 12

Molecular Weight: 223.098

Melting Point ($^{\circ}C$):

24.4–149 (Shiu & Mackay 1986; Shiu et al. 1987; quoted, Metcalfe et al. 1988)

Boiling Point ($^{\circ}C$):

312 (Shiu & Mackay 1986)

Chlorine Content: 31.77%

Density (g/cm^3 at $20^{\circ}C$): 1.30

Molar Volume (cm^3/mol):

226.4 (calculated-Le Bas method at normal boiling point, Shiu & Mackay 1986; Shiu et al. 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.06–1.5 (Mackay et al. 1983)

0.059–1.0 (Shiu et al. 1987)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.22 (quoted, Bopp 1983)

0.06–1.5, 2.20 (solid, supercooled liquid, Mackay et al. 1983a)

0.898–1.96, 1.60(exptl. range, calculated-UNIFAC, converted from log γ , Burkhard & Kuehl 1986)

1.6 (Mackay 1986; quoted, Metcalfe et al. 1988)

0.06–2.0, 1.02–2.26(selected, solid, supercooled liquid, Shiu et al. 1987)

0.06–2.0 (quoted range of individual congeners, Luthy et al. 1997)

Vapor Pressure (Pa at $25^{\circ}C$):

0.223 (quoted, supercooled liquid, Bopp 1983)

0.60 (quoted, supercooled liquid, Mackay et al. 1983a)

0.03–0.36 (Mackay et al. 1983)

0.24 (average, liquid, Mackay 1986; Metcalfe et al. 1988)

0.0018–0.279, 0.008–0.60 (solid, supercooled liquid, Shiu et al. 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

153.6 (calculated-P/C, Bopp 1983)

60.0 (Mackay et al. 1983a,b)

97.0 (calculated-P/C, Mackay et al. 1983a)

17–92.2 (calculated-P/C, Shiu et al. 1987)

Octanol/Water Partition Coefficient, log K_{ow} :

5.19 (Mackay et al. 1983a,b)

5.10 (Mackay 1986; Metcalfe et al. 1988)

4.9–5.3 (selected, Shiu et al. 1987)

5.13 (calculated-chlorine atoms, Formica et al. 1988)

5.10 (quoted mean value for isomers, Luthy et al. 1997)

Bioconcentration Factor, log BCF:

3.89 (biota, Mackay et al. 1983b)

3.80 (fish, selected, Mackay 1986; Metcalfe et al. 1988)

4.10 (calculated-MCI χ , Koch 1983)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , or Half Lives, $t_{1/2}$:

Volatilization/Evaporation: $k = 0.065 \text{ g m}^{-2} \text{ h}^{-1}$ (selected, Mackay 1986; Metcalfe et al. 1988).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (1.4 - 2.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime of 8–17 d at room temp. (Atkinson 1987)

$k_{OH}(\text{exptl}) = (2.0 - 4.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, the tropospheric lifetime is calculated to be 3.4–7.2 d (Kwok et al. 1995)

Hydrolysis:

Biodegradation: rate of degradation using species of *Alcaligenes* and *Acinetobacter*, $6 \times 10^{-8} \text{ nmol cell}^{-1} \cdot \text{h}^{-1}$ (Furukawa et al. 1978; quoted, NAS 1979);

$t_{1/2} \sim 2\text{--}3 \text{ d}$ for degradation, using river water dieaway test (Bailey et al. 1983).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 8–17 d due to calculated rate constant of gas-phase reaction with OH radicals for dichlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 3.4–7.2 d based on the calculated rate constant for gas-phase reaction with OH radicals for dichlorobiphenyls (Kwok et al. 1995).

Surface water: $t_{1/2} = 2\text{--}3 \text{ d}$ (Bailey et al. 1983).

Groundwater:

Sediment:

Soil:

Biota:

7.1.2.3 Trichlorobiphenyl

Common Name: Trichlorobiphenyl

Synonym:

Chemical Name: trichlorobiphenyl

CAS Registry No: 25323-68-6

Molecular Formula: $C_{12}H_7Cl_3$

No. of Isomers: 24

Molecular Weight: 257.543

Melting Point ($^{\circ}C$):

28–87 (Shiu & Mackay 1986; Metcalfe et al. 1988)

Boiling Point ($^{\circ}C$):

337 (average, Shiu & Mackay 1986; Metcalfe et al. 1988)

Chlorine Content: 41.4%

Density (g/cm^3):

Molar Volume (cm^3/mol):

247.3 (calculated-Le Bas method at normal boiling point Shiu & Mackay 1986; Shiu et al. 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.24–0.65 (Mackay et al. 1983)

0.244–0.651 (Shiu et al. 1987)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.05 (Neely 1980)

0.15–0.64, 0.67(solid, supercooled liquid, Mackay et al. 1983)

0.0654–1.09 (exptl. range, calculated-UNIFAC, converted from log γ , Burkhard & Kuehl 1986)

0.65 (quoted, Mackay 1986; Metcalfe et al. 1988)

0.015–0.40 (selected, Shiu et al. 1987)

0.015–0.40 (quoted, Formica et al. 1988)

0.015–0.40 (quoted range for individual congeners, Luthy et al. 1997)

Vapor Pressure (Pa at $25^{\circ}C$):

0.200 (Neely 1980)

0.0375 (supercooled liquid, Bopp 1983)

0.01–0.27, 0.20(solid, supercooled liquid, quoted, Mackay et al. 1983)

0.054 (average, liquid, Mackay 1986; Metcalfe et al. 1988)

0.0136–0.143, 0.003–0.022 (solid, supercooled liquid, Shiu et al. 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

81.76 (calculated-P/C, Bopp 1983)

82–102 (calculated-P/C, Mackay et al. 1983)

77 (selected, Mackay et al. 1983)

24.3–92.2 (calculated-P/C, Shiu et al. 1987)

Octanol/Water Partition Coefficient, log K_{ow} :

5.76 (Mackay et al. 1983)

5.50 (Mackay 1986; Metcalfe et al. 1988)

5.5–5.9 (selected, Shiu et al. 1987)

5.53 (calculated-chlorine atoms, Formica et al. 1988)

5.80 (quoted mean value of isomers, Luthy et al. 1997)

Bioconcentration Factor, log BCF:

4.20 (fish, Mackay 1986; Metcalfe et al. 1988)

4.70 (calculated-MCI χ , Koch 1983)

Sorption Partition Coefficient, $\log K_{OC}$:

Sorption Partition Coefficient, $\log K_p$:

- 3.34 (lake sediment, calculated, Formica et al. 1988)
- 3.50 (calculated-MCI χ , Koch 1983)

Environmental Fate Rate Constants, k , or Half Lives, $t_{1/2}$:

Volatilization/Evaporation: $k = 0.017 \text{ g m}^{-2} \text{ h}^{-1}$ (Mackay 1986; Metcalfe et al. 1988).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.7 - 1.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime of 14–30 d at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (1.0 - 2.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radicals for trichlorobiphenyls, the tropospheric lifetime is calculated to be 6.9–15 d (Kwok et al. 1995)

Hydrolysis:

Biodegradation: rate of degradation using species of *Alcaligenes* and *Acinetobacter*, $5 \times 10^{-8} \text{ nmol cell}^{-1} \cdot \text{h}^{-1}$ (Furukawa et al. 1978; quoted, NAS 1979).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 14–30 d due to calculated rate constant of gas-phase reaction with OH radicals for trichlorobiphenyls (Atkinson 1987);
tropospheric lifetime of 6.9–17 d based on the calculated rate constant for gas-phase reaction with OH radicals for trichlorobiphenyls (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment:

Soil:

Biota: estimated $t_{1/2} = 134 \text{ h}$ from fish in simulated ecosystem (Neely 1980).

7.1.2.4 Tetrachlorobiphenyl

Common Name: Tetrachlorobiphenyl

Synonym:

Chemical Name: tetrachlorobiphenyl

CAS Registry No: 26914-33-0

Molecular Formula: $C_{12}H_6Cl_4$

No. of Isomers: 42

Molecular Weight: 291.988

Melting Point ($^{\circ}C$):

47–180 (Shiu & Mackay 1986; Shiu et al. 1987; Metcalfe et al. 1988)

Boiling Point ($^{\circ}C$):

360 (average, Shiu & Mackay 1986; Metcalfe et al. 1988)

Chlorine Content: 48.6%

Density (g/cm^3 at $20^{\circ}C$): 1.5

Molar Volume (cm^3/mol):

268.2 (Le Bas method at normal boiling point, Shiu & Mackay 1986; Shiu et al. 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.1–0.68 (Mackay et al. 1983)

0.029–0.606 (Shiu et al. 1987)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.05 (Neely 1980)

0.0008–0.17 (Mackay et al. 1983)

0.017 (McCall et al. 1983)

0.02–0.0955, 0.224 (exptl. range, calculated-UNIFAC, converted from $\log \gamma$, Burkhard & Kuehl 1986)

0.26 (quoted, Mackay 1986; Metcalfe et al. 1988)

0.0043–0.10 (selected, Shiu et al. 1987)

0.039–0.38 (selected, supercooled liquid, Shiu et al. 1987)

0.001–0.10 (Formica et al. 1988)

0.001–0.10 (quoted range for individual congeners, Luthy et al. 1997)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0653 (Neely 1980)

0.0064 (supercooled liquid, Bopp 1983)

0.003–0.104 (Mackay et al. 1983)

0.06 (supercooled liquid, Mackay et al. 1983)

0.0653 (McCall et al. 1983)

0.012 (Mackay 1986; Metcalfe et al. 1988)

5.9×10^{-5} – 5.4×10^{-3} (selected, Shiu et al. 1987)

0.002 (selected, supercooled liquid, Shiu et al. 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

34.69 (calculated-P/C, Bopp 1983)

75–94 (calculated-P/C, Mackay et al. 1983)

76.0 (Mackay et al. 1983)

1.72–47.59 (calculated-P/C, Shiu et al. 1987)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.35 (suggested, Mackay et al. 1983)

5.90 (Mackay 1986; Metcalfe et al. 1988)

5.6–6.5 (selected, Shiu et al. 1987)

- 5.93 (calculated-chlorine atoms, Formica et al. 1988)
 6.00 (quoted mean value for isomers, Luthy et al. 1997)

Bioconcentration Factor, log BCF:

- 3.98 (pinfish, Branson et al. 1975; quoted, Waid 1986)
 3.95 (trout, Branson et al. 1975; quoted, NAS 1979)
 4.79 (McCall et al. 1983)
 4.60 (fish, Mackay 1986; Metcalfe et al. 1988)
 5.30 (calculated-MCI χ , Koch 1983)

Sorption Partition Coefficient, log K_{OC} :

- 4.51 (correlated, McCall et al. 1983)
 3.43–5.11 (correlated of literature values in high clay soils, Sklarew & Girvin 1987)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization/Evaporation: $k = 4.2 \times 10^{-3} \text{ g m}^{-2} \text{ h}^{-1}$ (Mackay 1986; Metcalfe et al. 1988).

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.4 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime of 25–60 d at room temp. (Atkinson 1987)

$k_{OH}(\text{calc}) = (0.36 - 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radicals for tetrachlorobiphenyls, the tropospheric lifetime is calculated to be 8.5–40 d (Kwok et al. 1995).

Hydrolysis:

Biodegradation: rate of degradation for both rings substituted with chlorine using species of *Alcaligenes* and *Acinetobacter*, $2.5 \times 10^{-8} \text{ nmol cell}^{-1} \text{ h}^{-1}$ (Furukawa et al. 1978; selected, NAS 1979);
 no degradation by river dieaway test after 98 d of incubation (Bailey et al. 1983).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: calculated tropospheric lifetime of 25–60 d due to calculated rate constant of gas-phase reaction with OH radicals for tetrachlorobiphenyls (Atkinson 1987);
 tropospheric lifetime of 8.5–40 d based on the calculated rate constant for gas-phase reaction with OH radicals for tetrachlorobiphenyls (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment:

Soil: volatilization $t_{1/2} \sim 10 \text{ d}$ from an Ottawa sand (estimated, Haque et al. 1974; selected, Pal et al. 1980).

Biota: estimated $t_{1/2} = 139 \text{ h}$ from fish in simulated ecosystem (Neely 1980).

7.1.2.5 Pentachlorobiphenyl

Common Name: Pentachlorobiphenyl

Synonym:

Chemical Name: pentachlorobiphenyl

CAS Registry No: 25429-29-2

Molecular Formula: $C_{12}H_5Cl_5$

No. of Isomers: 46

Molecular Weight: 326.433

Melting Point ($^{\circ}C$):

−23.5–124 (Shiu et al. 1987)

76.5–124 (Shiu & Mackay 1986; Metcalfe et al. 1988)

Boiling Point ($^{\circ}C$):

381 (average, Shiu & Mackay 1986; Metcalfe et al. 1988)

Chlorine Content: 54.4%

Density (g/cm^3 at $20^{\circ}C$): 1.50

Molar Volume (cm^3/mol):

289.1 (Le Bas method at normal boiling point, Shiu & Mackay 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.1–0.31 (Mackay et al. 1983)

0.105–0.311 (Shiu et al. 1987)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.01 (Neely 1980)

0.004–0.03 (Mackay et al. 1983)

0.072 (supercooled liquid, Mackay et al. 1983)

0.0338–0.0525, 0.0829 (experimental range, calculated-UNIFAC, converted from $\log \gamma$, Burkhard & Kuehl 1986)

0.099 (Mackay 1986; Metcalfe et al. 1988)

0.004–0.02 (selected, Shiu et al. 1987)

0.03–0.11 (selected, supercooled liquid, Shiu et al. 1987)

0.004–0.02 (Formica et al. 1988)

0.024 (selected average value of isomers, Mackay 1989)

0.004–0.02 (quoted range of individual congeners, Luthy et al. 1997)

Vapor Pressure (Pa at $25^{\circ}C$):

0.01026 (Neely 1980)

0.00111 (supercooled liquid, Bopp 1983)

0.015 (supercooled liquid, Mackay et al. 1983)

0.004–0.03 (Mackay et al. 1983)

0.0026 (Mackay 1986; Metcalfe et al. 1988)

0.000304–0.0093 (selected, Shiu et al. 1987)

0.0023–0.051 (selected, supercooled liquid, Shiu et al. 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

68.0 (suggested, Mackay et al. 1983)

17.34 (calculated-P/C, Bopp 1983)

24.8–151.4 (selected, Shiu et al. 1987)

12.2 (calculated, Mackay 1989)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.85 (suggested, Mackay et al. 1983)

6.33 (calculated-chlorine atoms, Formica et al. 1988)

- 6.30 (Mackay 1986; Metcalfe et al. 1988)
 6.2–6.5 (selected, Shiu et al. 1987)
 6.60 (selected, Mackay 1989)
 6.40 (quoted mean value for isomers of a homolog group, Luthy et al. 1997)

Bioconcentration Factor, log BCF:

- 5.0 (fish, Mackay 1986; Metcalfe et al. 1988)
 5.30 (Mackay 1989)
 5.90 (calculated-MCI χ , Koch 1983)

Sorption Partition Coefficient, log K_{OC} :

- 6.21 (calculated, $0.41K_{OW}$, Mackay 1989)

Sorption Partition Coefficient, log K_p :

- 4.15 (lake sediment, calculated- K_{OW} , f_{OC} , Formica et al. 1988)
 4.51 (calculated-MCI χ , Koch 1983)

Environmental Fate Rate Constants, k, and Half Lives, $t_{1/2}$:

Volatilization /Evaporation: $k = 1.0 \times 10^{-3} \text{ g m}^{-2} \text{ h}^{-1}$ (Mackay 1986; Metcalfe et al. 1988).

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.2 - 0.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp., with a calculated tropospheric lifetime of 60–120 d (Atkinson 1987);

$k_{OH}(\text{calc}) = (0.3 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radicals for pentachlorobiphenyls, the tropospheric lifetime is calculated to be 16–48 d (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.62\text{--}1.4 \text{ d}$ for atmospheric photodegradation (Dilling et al. 1983);

calculated tropospheric lifetime of 60–120 d due to calculated rate constant of gas-phase reaction with OH radicals for pentachlorobiphenyls (Atkinson 1987);

tropospheric lifetime of 17–48 d based on the calculated rate constant for gas-phase reaction with OH radicals for pentachlorobiphenyls (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment:

Soil: volatilization $t_{1/2} = 25 \text{ d}$ from an Ottawa sand (estimated, Haque et al. 1974; selected, Pal et al. 1980).

Biota: estimated $t_{1/2} = 226 \text{ d}$ from fish in simulated ecosystem (Neely 1980).

7.1.2.6 Hexachlorobiphenyl

Common Name: Hexachlorobiphenyl

Synonym:

Chemical Name: hexachlorobiphenyl

CAS Registry No: 26601-64-9

Molecular Formula: $C_{12}H_4Cl_6$

No. of Isomers: 42

Molecular Weight: 360.878

Melting Point ($^{\circ}C$):

85–160 (Shiu et al. 1987)

77–150 (Shiu & Mackay 1986; Metcalfe et al. 1988)

Boiling Point ($^{\circ}C$):

400 (average, Shiu & Mackay 1986; Metcalfe et al. 1988)

Chlorine Content: 62.77% (Hutzinger et al. 1974)

Density (g/cm^3 at $20^{\circ}C$): 1.60

Molar Volume (cm^3/mol):

310.0 (Le Bas method at normal boiling point, Shiu & Mackay 1986; Shiu et al. 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.06–0.25 (Mackay et al. 1983)

0.0582–0.256 (Shiu & Mackay 1986)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0004–0.01, 0.021 (solid, supercooled liquid, Mackay et al. 1983)

0.00303–0.0504, 0.00297 (experimental range, calculated-UNIFAC, converted from $\log \gamma$, Burkhard & Kuehl 1986)

0.038 (Mackay 1986; Metcalfe et al. 1988)

0.0004–0.001, 0.0022–0.01 (solid, supercooled liquid, Shiu et al. 1987)

0.0004–0.005 (Formica et al. 1988)

0.0035 (Mackay & Paterson 1991)

0.0004–0.001 (quoted range, Luthy et al. 1997)

Vapor Pressure (Pa at $25^{\circ}C$):

0.000182 (supercooled liquid, Bopp 1983)

0.0016, 0.005 (solid, supercooled liquid, Mackay et al. 1983)

5.8×10^{-4} (Mackay 1986; Metcalfe et al. 1988)

2.0×10^{-5} – 1.59×10^{-3} , 7.0×10^{-4} – 0.012 (solid, supercooled liquid, Shiu et al. 1987)

0.0005 (selected, Mackay & Paterson 1991)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

86.0 (Mackay et al. 1983)

6.70 (calculated-P/C, Bopp 1983)

11.9–81.8 (calculated-P/C, Shiu et al. 1987)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.70–7.30 (selected, Shiu et al. 1987)

6.70 (selected, Mackay 1986; Metcalfe et al. 1988)

6.80 (selected, Mackay & Paterson 1991)

7.00 (quoted mean value for isomers of a homolog group, Luthy et al. 1997)

Bioconcentration Factor, $\log BCF$:

6.50 (calculated-MCI χ , Koch 1983)

5.39 (fish, selected, Mackay 1986; Metcalfe et al. 1988)

4.57 (green alga, Mailhot 1987)

Sorption Partition Coefficient, $\log K_{OC}$:

4.785–6.869 (correlated literature values in high clay soils, Sklarew & Girvin 1987)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization/Evaporation: $2.5 \times 10^{-4} \text{ g m}^{-2} \text{ h}^{-1}$ (Mackay 1986; Metcalf et al. 1988).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (0.16 - 0.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp., the tropospheric lifetime is calculated to be 29–60 d (Kwok et al. 1995)

Hydrolysis:

Biodegradation: degradation rate constants estimated to be $1.5 \times 10^{-5} \text{ h}^{-1}$ in water, soil and sediment (Mackay & Patterson 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: the tropospheric lifetime of 29–90 d based on the calculated rate constant for gas-phase reaction with OH radicals for hexachlorobiphenyls (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment:

Soil: volatilization $t_{1/2} = 40 \text{ d}$ from an Ottawa sand (estimated, Haque et al. 1974; selected, Pal et al. 1980).

Biota:

7.1.2.7 Heptachlorobiphenyl

Common Name: Heptachlorobiphenyl

Synonym:

Chemical Name: heptachlorobiphenyl

CAS Registry No: 28655-71-2

Molecular Formula: $C_{12}H_3Cl_7$

No. of Isomers: 24

Molecular Weight: 395.323

Melting Point ($^{\circ}C$):

122.4–149 (Shiu & Mackay 1986; Shiu et al. 1987; Metcalfe et al. 1988)

Boiling Point ($^{\circ}C$):

417 (average, Shiu & Mackay 1986; Metcalfe et al. 1988)

Chlorine Content: 62.77% (Hutzinger et al. 1974)

Density (g/cm^3 at $20^{\circ}C$): 1.70

Molar Volume (cm^3/mol):

330.9 (Le Bas method at normal boiling point, Shiu & Mackay 1986)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.0596–0.109 (Shiu et al. 1987)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0005, 0.006 (solid, supercooled liquid, Mackay et al. 1983)

0.00816–0.0205, 0.011 (experimental range, calculated-UNIFAC, converted from $\log \gamma$, Burkhard & Kuehl 1986)

Octanol/Water Partition Coefficient, log K_{ow} :

> 5.58 (shake flask, Chiou et al. 1977; Callahan et al. 1979; Veith et al. 1979a; Kenaga & Goring 1980; Mabey et al. 1982; Mackay 1982)

4.38 (shake flask-GC, Paris et al. 1978; quoted, Callahan et al. 1979; Ryan et al. 1988)

5.88 (HPLC-RT correlation, Veith et al. 1979b; Garten & Trabalka 1983)

3.48 (Pal et al. 1980; Sklarew & Girvin 1987)

- 4.3–5.48 (quoted, Mills et al. 1982)
 4.40–5.80 (selected, Mackay et al. 1983; Mackay 1986; Metcalfe et al. 1988)
 5.31 (quoted, Chou & Griffin 1986)

Bioconcentration Factor, log BCF:

- 3.80, 3.81, 3.74 (bacteria: Doe Run pond, Hickory Hills pond, USDA pond, Paris et al. 1978)
 4.18 (fish in Hudson River, Skea et al. 1979; quoted, Waid 1986)
 4.63 (fathead minnow, 32-d exposure, Veith et al. 1979b; Veith & Kosian 1983)
 4.69, 3.81 (fish, flowing water, static water, Kenaga & Goring 1980)
 4.69 (quoted, Bysshe 1982)
 4.70 (microorganism, calculated- K_{OW} , Mabey et al. 1982)
 4.63; 4.56 (fish, quoted; calculated- K_{OW} , Mackay 1982)
 0.15 (rodents, Garten & Trabalka 1983)
 4.63 (fish, Garten & Trabalka 1983)
 4.63 (fathead minnow, quoted, Zaroogian et al. 1985)
 4.24, 4.30 (oyster, quoted, Zaroogian et al. 1985)
 3.11–4.5 (fish, selected, Mackay 1986; Metcalfe et al. 1988)

Sorption Partition Coefficient, log K_{OC} :

- 5.19, 5.23, 4.96, 4.73 (bottom sediments of: Oconee River pH 6.5, USDA Pond pH 6.4, Doe Run Pond pH 6.1, Hickory Hill Pond pH 6.3, batch equilibration-GC, Steen et al. 1978)
 5.26 (calculated- K_{OW} , Mabey et al. 1982)
 4.87 (calculated, Sklarew & Girvin 1987)
 4.25 (soil, calculated-S, Chou & Griffin 1986)
 5.03, 4.97 (sediments: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, average, Delle Site 2001)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

- Volatilization/Evaporation: volatilization $t_{1/2} = 9.9$ h (Paris et al. 1978, quoted Callahan et al. 1979);
 rate constant $k = 0.031$ g m⁻² h⁻¹ (Mackay 1986; Metcalfe et al. 1988).
 Photolysis:
 Hydrolysis: not environmentally significant (Mabey et al. 1982).
 Oxidation: calculated rate constant for singlet oxygen, $k \ll 360$ M⁻¹ h⁻¹ and $k \ll 1$ M⁻¹ h⁻¹ for RO₂ (peroxy radical) (Mabey et al. 1982).
 Biodegradation: 32.9% degraded by activated sludge in 47-h cycle (Monsanto Co. 1972);
 33% degraded by activated sludge for 48-h exposure (Tucker et al. 1975; Versar Inc. 1979; quoted, Pal et al. 1980);
 rate constant $k = 0.2$ d⁻¹ by acclimated activated sludge with $t_{1/2} = 3.5$ d (Callahan et al. 1979).
 96% loss by degradation with Nocardia strain NCIB 10603 and 91% loss with NCIB 10643, both within 52 d; > 98% loss with NCIB 10603 and > 96% loss with NCIB 10643, both within 100 d (Baxter et al. 1975; quoted, Pal et al. 1980).
 Biotransformation: $k \sim 3 \times 10^{-9}$ to 3×10^{-12} mL cell⁻¹ h⁻¹, estimated for bacteria transformation in water (Mabey et al. 1982).
 Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

- Air:
 Surface water: $t_{1/2} = 9.9$ h in 1 m³ water of 1-m deep (Paris et al. 1978; selected, Callahan et al. 1979; Mills et al. 1982)
 Groundwater:
 Sediment:
 Soil: $t_{1/2} > 50$ d (Ryan et al. 1988).
 Sludge: estimated $t_{1/2} = 15$ d for the volatilization from activated sludge under aerobic conditions (Tucker et al. 1975; quoted, Pal et al. 1980).
 Biota: $t_{1/2} \sim 1.2$ yr in fish in Hudson River (Armstrong & Sloan 1985).

7.1.3.2 Aroclor 1221

Common Name: Aroclor 1221

Synonym:

Chemical Name:

CAS Registry No: 11104-28-2

Molecular Formula:

Average Molecular Weight: 192–200.7

Physical State: mobile oil

Distillation Range (°C):

275–320 (NAS 1979; Brinkman & De Kock 1980)

Chlorine Content: 20.5–21.5%

Density (g/cm³):

1.182–1.19 (25°C, NAS 1979)

1.18 (20°C, Brinkman & De Kock 1980)

1.15 (Callahan et al. 1979; Mills et al. 1982)

Molar Volume (cm³/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56$ J/mol K), F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated):

5.00 (Zitko 1970, 1971)

3.5 (23°C, shake flask-GC/ECD, Griffin et al. 1978; quoted, Chou & Griffin 1986)

15.0 (Monsanto Co. 1972; quoted, Callahan et al. 1979; Pal et al. 1980; Mills et al. 1982)

3.52 (shake flask-GC/ECD, Lee et al. 1979)

0.59 (shake flask-nephelometric, Hollifield 1979)

40.0 (calculated- K_{OW} , Mabey et al. 1982)

3.50–15.0 (selected, Mackay et al. 1983)

Vapor Pressure (Pa at 25°C):

0.893 (Monsanto Co. 1972; quoted, Callahan et al. 1979; Mabey et al. 1982; Mills et al. 1982)

0.93 (Pal et al. 1980)

0.89 (quoted, Mackay et al. 1983)

Henry's Law Constant (Pa m³/mol):

0.750 (Hetling et al. 1978)

17.23 (calculated-P/C, Mabey et al. 1982)

60.0 (suggested value, Mackay et al. 1983)

23.10 (calculated, Burkhard et al. 1985b)

Octanol/Water Partition Coefficient, log K_{OW} :

2.8 (Monsanto Co. 1972; quoted, Callahan et al. 1979)

2.81 (Pal et al. 1980)

4.08 (Callahan et al. 1979; Mabey et al. 1982)

4.10–4.70 (quoted, Mackay et al. 1980)

2.78–4.0 (quoted, Mills et al. 1982)

4.09 (quoted, Chou & Griffin 1986)

4.09 (quoted, Ryan et al. 1988)

Bioconcentration Factor, log BCF:

3.34 (microorganism, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, log K_{OC} :

3.76 (sediment, calculated- K_{OW} , Mabey et al. 1982)

3.62 (soil, calculated-S, Chou & Griffin 1986)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: estimated $k \sim 1.74 \text{ mg cm}^{-2} \text{ h}^{-1}$ from liquid substrate at 100°C (Hutzinger et al. 1974; quoted, Pal et al. 1980).

Photolysis:

Hydrolysis: not environmentally significant (Mabey et al. 1982).

Oxidation: calculated rate constant for singlet oxygen, $k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ and $k \ll 1 \text{ M}^{-1} \text{ h}^{-1}$ for RO_2 (peroxy radical) (Mabey et al. 1982).

Biodegradation: 80.6% degraded by activated sludge in 47-h cycle (Monsanto Co. 1972; quoted, Pal et al. 1980); 81% degraded by activated sludge for 48-h exposure (Versar Inc. 1979; quoted, Pal et al. 1980); $k = 0.8 \text{ d}^{-1}$ and $t_{1/2} = 0.9 \text{ d}$ for biodegradation by acclimated activated sludge (Callahan et al. 1979).

Biotransformation: estimated $k \sim 3 \times 10^{-9}$ to $3 \times 10^{-12} \text{ mL cell}^{-1} \text{ h}^{-1}$ rate of transformation for bacteria in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water:

Groundwater:

Sediment:

Soil: $t_{1/2} > 50 \text{ d}$ (Ryan et al. 1988).

Sludge: estimated $t_{1/2} = 12 \text{ d}$ of volatilization from activated sludge to be 12 d under aerobic conditions (Tucker et al. 1975; quoted, Pal et al. 1980).

Biota:

7.1.3.3 Aroclor 1232

Common Name: Aroclor 1232

Synonym:

Chemical Name:

CAS Registry No: 11141-16-5

Molecular Formula:

Average Molecular Weight: 221–232.2

Physical State: mobile oil

Distillation Range (°C):

270–325 (NAS 1979; Brinkman & De Kock 1980)

Chlorine Content: 32%

Density (g/cm³):

1.260 (20°C, Brinkman & De Kock 1980)

1.27–1.28 (25°C, NAS 1979)

1.24 (Callahan et al. 1979; Mills et al. 1982)

Molar Volume (cm³/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56$ J/mol K), F:

Water Solubility (g/m³ or mg/L at 25°C):

1.45 (Monsanto Co. 1972; quoted, Callahan et al. 1979; Chou & Griffin 1986)

1.45 (quoted, Pal et al. 1980; Mackay et al. 1983)

407 (calculated- K_{OW} , Mabey et al. 1982)

Vapor Pressure (Pa at 25°C):

0.54 (Monsanto Co. 1972; Callahan et al. 1979; Mabey et al. 1982)

0.533 (quoted, Mills et al. 1982)

0.54 (quoted, Mackay et al. 1983)

Henry's Law Constant (Pa m³/mol):

60.0 (suggested, Mackay et al. 1980)

1.14 (calculated-P/C, Mabey et al. 1982)

Octanol/Water Partition Coefficient, log K_{OW} :

3.2 (Monsanto Co. 1972; Callahan et al. 1979; Mabey et al. 1982)

4.54 (Tulp & Hutzinger 1978; Callahan et al. 1979)

3.23 (quoted, Pal et al. 1980)

3.18–4.48 (quoted, Mills et al. 1982)

4.10–5.20 (quoted, Mackay et al. 1983)

4.62 (calculated-S, Chou & Griffin 1986)

4.54 (quoted, Ryan et al. 1988)

Bioconcentration Factor, log BCF:

2.54 (microorganism, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, log K_{OC} :

2.89 (sediment, calculated- K_{OW} , Mabey et al. 1982)

3.85 (soil, calculated-S, Chou & Griffin 1986)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis: not environmentally significant (Mabey et al. 1982).

Oxidation: calculated rate constant for singlet oxygen $k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ and $k \ll 1 \text{ M}^{-1} \cdot \text{h}^{-1}$ for RO_2 (peroxy radical) (Mabey et al. 1982).

Biodegradation: aerobic biodegradation $t_{1/2} = 61.4 \text{ d}$ without the addition of polymer chitin, $t_{1/2} = 33.4 \text{ d}$ with chitin and $t_{1/2} = 26.8 \text{ d}$ with chitin plus adapted microbes in flow microcosm systems with water and sedimentary materials collected from the field (Portier & Fujisaki 1988; quoted, Abramowicz 1990).

Biotransformation: $k \sim 3 \times 10^{-9}$ to $3 \times 10^{-12} \text{ mL} \cdot \text{cell}^{-1} \cdot \text{h}^{-1}$, estimated rate of transformation for bacteria in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water: aerobic biodegradation $t_{1/2} = 61.4 \text{ d}$ without the addition of polymer chitin, $t_{1/2} = 33.4 \text{ d}$ with chitin and $t_{1/2} = 26.8 \text{ d}$ with chitin plus adapted microbes in flow microcosm systems with water and sedimentary materials collected from the field (Portier & Fujisaki 1988; quoted, Abramowicz 1990).

Groundwater:

Sediment:

Soil: $t_{1/2} > 50 \text{ d}$ (Ryan et al. 1988).

Biota:

7.1.3.4 Aroclor 1242

Common Name: Aroclor 1242

 50.0 (calculated, Mackay et al. 1986)
 34.45 (calculated-P/C, Eisenreich 1987)
 23.0 (20°C, quoted, Murphy et al. 1987 from Burkhard et al. 1985b)
 28.31 (20°C, equilibrium concn. ratio, Murphy et al. 1987)
 28.27 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 12.869 - 4339/(T/K)$ (van't Hoff eq. derived from lit. data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 4.11 (Callahan et al. 1979; Mabey et al. 1982; quoted, Ryan et al. 1988)
 5.58 (HPLC-RT correlation, Veith et al. 1979a; quoted, Kenaga & Goring 1980)
 0.703 (shake flask-GC/ECD, Lee et al. 1979)
 3.54 (Pal et al. 1980; quoted, Sklarew & Girvin 1987)
 4.0–5.6 (quoted, Mills et al. 1982)
 4.50–5.80 (quoted, Mackay et al. 1983; Mackay 1986; Metcalfe et al. 1988; Eisenreich 1987)
 5.90 (Rapaport & Eisenreich 1984)
 5.74 (literature mean, Di Toro et al. 1985)
 5.29 (quoted, Chou & Griffin 1986)

Bioconcentration Factor, $\log BCF$:

- 3.92, 3.65, 3.46 (bacteria: Doe Run pond, Hickory Hills pond, USDA pond, Paris et al. 1978)
 0.08, –0.22 (adipose tissue of male, female Albino rats, Geyer et al. 1980)
 4.69, 3.81 (fish, flowing water, static water, Kenaga & Goring 1980)
 4.69 (quoted, Bysshe 1982)
 3.36 (microorganism, calculated- K_{OW} , Mabey et al. 1982)
 0.30, 0.13, –0.11, –0.50, –0.27 (rodent, poultry, sheep, small birds, swine, Garten & Trabalka 1983)
 3.20–4.51 (fish, selected, Mackay 1986; Metcalfe et al. 1988)
 4.69, 5.99 (fish 5% lipid in flow-through system: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.13, 5.18, 4.89, 4.70 (bottom sediments of: Oconee River pH 6.5, USDA Pond pH 6.4, Doe Run Pond pH 6.1, Hickory Hill Pond pH 6.3, batch equilibration-GC, Steen et al. 1978)
 3.80 (sediment, calculated- K_{OW} , Mabey et al. 1982)
 4.17 (Lake Michigan sediment, 0.7–3.8% OC, Eadie et al. 1983)
 3.36 (calculated, Sklarew & Girvin 1987)
 4.09 (soil, calculated-S, Chou & Griffin 1986)
 4.30, 4.12, 4.64 (soils: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, $0.1 \leq OC < 0.5\%$, and pH 2.0 to > 10, average, Delle Site 2001)
 4.82, 4.74 (sediments: organic carbon $OC \geq 0.1\%$, $OC \geq 0.5\%$, average, Delle Site 2001)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization/Evaporation: $k = 0.23 \mu\text{g m}^{-2} \text{d}^{-1}$ with $t_{1/2} = 17 \text{ d}$ (Baker et al. 1986);
 $k = 0.029 \text{ g m}^{-2} \text{h}^{-1}$ (Mackay 1986; Metcalfe et al. 1988).

Photolysis:

Hydrolysis: not environmentally significant (Mabey et al. 1982).

Oxidation: calculated rate constant for singlet oxygen, $k \ll 360 \text{ M}^{-1} \text{h}^{-1}$ and $k \ll 1 \text{ M}^{-1} \text{h}^{-1}$ for RO_2 (peroxy radical) (Mabey et al. 1982).

Biodegradation: 26.3% degraded by activated sludge in 47-h cycle (Monsanto Co. 1972; quoted, Pal et al. 1980);
26% degraded by activated sludge for 48-h exposure (Versar Inc. 1979; quoted, Pal et al. 1980);
degraded by acclimated activated sludge with a first-order rate constant $k = 0.15 \text{ d}^{-1}$ and $t_{1/2} = 4.5 \text{ d}$ (Callahan et al. 1979).

88% loss by degradation with *Nocardia* strain NCIB 10603, 76% loss with NCIB 10643 both within 52 d; 95% loss with NCIB 10603 and 85% loss with NCIB 10643 both within 100 d (Baxter et al. 1975; quoted, Pal et al. 1980).

Biotransformation: estimated $k \sim 3 \times 10^{-9}$ to $3 \times 10^{-12} \text{ mL}\cdot\text{cell}^{-1}\cdot\text{h}^{-1}$ for bacteria transformation in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air:

Surface water: $t_{1/2} = 12 \text{ h}$ (Paris et al. 1978); volatilization $t_{1/2} \sim 12 \text{ h}$ at 1 m depth in 1 m^3 of water (Mackay & Leinonen 1975; quoted, Pal et al. 1980; Mills et al. 1982).

Groundwater:

Sediment:

Soil: $t_{1/2} > 50 \text{ d}$ (Ryan et al. 1988).

Biota:

7.1.3.5 Aroclor 1248

Common Name: Aroclor 1248

Synonym:

Chemical Name:

CAS Registry No: 12672-29-6

Molecular Formula:

Average Molecular Weight: 288–299.5

Physical State: mobile oil

Distillation Range (°C):

340–375 (NAS 1979; Brinkman & De Kock 1980; Mackay et al. 1986)

Chlorine Content: 48%

Density (g/cm³):

1.44 (20°C, Brinkman & De Kock 1980)

1.40–1.41 (NAS 1979)

1.41 (Callahan et al. 1979)

1.40 (Mackay 1986; Mills et al. 1982; Metcalfe et al. 1988)

Molar Volume (cm³/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56$ J/mol K), F:

Water Solubility (g/m³ or mg/L at 25°C):

0.10 (20°C, Nisbet & Sarofim 1972)

0.10 (Monsanto Co. 1972; selected, Hutzinger et al. 1974; Sawhney 1987)

0.043 (26°C, Hutzinger et al. 1974)

0.054 (Mackay & Wolkoff 1973; Mackay & Leinonen 1975; Mackay et al. 1983, 1986)

0.054 (NAS 1979; Callahan et al. 1979; Pal et al. 1980; Mabey et al. 1982; Mills et al. 1982; Chou & Griffin 1986)

0.060 (shake flask-nephelometry, Hollifield 1979)

0.052 (quoted, Brinkman & De Kock 1980; Erickson 1986)

0.32 (selected, Mackay 1986; Metcalfe et al. 1988)

0.056 (selected, Eisenreich 1987)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations):

0.004 (20°C, Nisbet & Sarofim 1972)

0.066 (selected, Mackay & Wolkoff 1973; Mackay & Leinonen 1975; quoted, Mills et al. 1982)

0.11 (20°C, extrapolated, Monsanto 1972; quoted, NAS 1979)

$\log(P_L/\text{mmHg}) = 8.40 - 3400/(T/K)$ (temp range 150–300°C, from Monsanto 1972, NAS 1979)

0.017 (Branson 1977; Kenaga & Goring 1980)

0.066 (Callahan et al. 1979; Mabey et al. 1982; Mackay et al. 1983)

0.025, 0.024 (GC-RT correlation, Foreman & Bidleman 1985)

0.0085 (selected, Eisenreich 1987)

0.023 (selected, Mackay 1986; Metcalfe et al. 1988)

Henry's Law Constant (Pa m³/mol):

355.7 (calculated, Mackay & Leinonen 1975)

372 (Slinn et al. 1978)

364 (calculated-P/C, Mabey et al. 1982)

86.0 (calculated-P/C, Mackay et al. 1983)

44.58 (calculated, Burkhard et al. 1985b; quoted, Eisenreich 1987)

50.0 (calculated-P/C, Mackay et al. 1986)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

5.75 (Callahan et al. 1979; Kenaga & Goring 1980; Mabey et al. 1982; Chou & Griffin 1986)

- 6.11 (shake flask-GC, Chiou et al. 1977; quoted, Callahan et al. 1979)
- 6.11 (HPLC-RT correlation, Veith et al. 1979a,b; quoted, Mackay 1982; Garten & Trabalka 1983)
- 6.0 (quoted, Mills et al. 1982)
- 5.8–6.3 (quoted, Mackay et al. 1983, 1986; Mackay 1986; Metcalfe et al. 1988; Eisenreich 1987)
- 5.60 (quoted, Ryan et al. 1988)
- 6.10 (selected, Thomann 1989)

Bioconcentration Factor, log BCF:

- 4.42 (bluegill sunfish, Stalling & Meyer 1972)
- 4.75–4.79 (channel catfish, Mayer et al. 1977; quoted, Waid 1986)
- 5.08 (fathead minnow, DeFoe et al. 1978; quoted, Waid 1986)
- 4.85 (fathead minnow, 32-d exposure, Veith et al. 1979b)
- 4.86, 4.07 (fish, flowing water, static water, Kenaga & Goring 1980)
- 4.86 (quoted, Bysshe 1982)
- 3.86–4.42, 4.19 (mussel, range, average, Geyer et al. 1982)
- 4.86 (microorganism, calculated- K_{OW} , Mabey et al. 1982)
- 4.85, 4.79 (fish: quoted, calculated- K_{OW} , Mackay 1982)
- 4.85, 0.82, 0.72 (fish, poultry, rodents, Garten & Trabalka 1983)
- 4.5–5.0 (fish, selected, Mackay 1986; Metcalfe et al. 1988)
- 4.80, 6.08 (fathead minnow, male: wet wt basis, lipid wt basis, Geyer et al. 2000)
- 5.08, 6.08 (fathead minnow, female: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, log K_{OC} :

- 5.44 (sediment, calculated- K_{OW} , Mabey et al. 1982)
- 4.74 (soil, calculated-S, Chou & Griffin 1986)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

- Volatilization/Evaporation: $k = 8.3 \times 10^{-3} \text{ g m}^{-2} \cdot \text{h}^{-1}$ (Mackay 1986; Metcalfe et al. 1988).
- Photolysis: TiO_2 catalyzed photolytic process destroyed 80% of total PCBs in an aqueous solution and clay suspension after 4 h of radiation, and 50% destroyed in sediment suspension within 6 h (Zhang et al. 1993).
- Hydrolysis: not environmentally significant (Mabey et al. 1982).
- Oxidation: calculated rate constant for singlet oxygen, $k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ and $k \ll 1 \text{ M}^{-1} \text{ h}^{-1}$ for RO_2 (peroxy radical) (Mabey et al. 1982).
- Biodegradation: aerobic biodegradation $t_{1/2} = 77.6 \text{ d}$ without the addition of polymer chitin, $t_{1/2} = 38.6 \text{ d}$ with chitin and $t_{1/2} = 31.9 \text{ d}$ with chitin plus adapted microbes in flow microcosm systems with water and sedimentary materials collected from the field (Portier & Fujisaki 1988; quoted, Abramowicz 1990).
- Biotransformation: estimated $k \sim 3 \times 10^{-9}$ to $3 \times 10^{-12} \text{ mL} \cdot \text{cell}^{-1} \cdot \text{h}^{-1}$ for bacteria transformation in water (Mabey et al. 1982).
- Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:
 $\log k_2 = -1.92 \text{ d}^{-1}$ (fish, quoted, Thomann 1989)

Half-Lives in the Environment:

Air:

- Surface water: volatilization $t_{1/2} \sim 10 \text{ h}$ at 1 m depth in 1 m^3 water (Mackay & Leinonen 1975; quoted, Pal et al. 1980; Mills et al. 1982);
 TiO_2 catalyzed photolytic process destroyed 80% of total PCBs in an aqueous solution and clay suspension after 4 h of radiation, and 50% destroyed in sediment suspension within 6 h (Zhang et al. 1993).

Groundwater:

Sediment:

- Soil: $t_{1/2} > 50 \text{ d}$ (Ryan et al. 1988).

Biota:

7.1.3.6 Aroclor 1254

Common Name: Aroclor 1254

Synonym:

Chemical Name:

CAS Registry No: 11097-69-1

Molecular Formula:

Average Molecular Weight: 327–328.4

Physical State: viscous liquid

Distillation Range (°C):

365–390 (NAS 1979; Brinkman & De Kock 1980; Mackay et al. 1986)

Chlorine Content: 54%

Density (g/cm³):

1.505 (Monsanto 1972)

1.49–1.50 (65°C, NAS 1979)

1.54 (20°C Brinkman & De Kock 1980)

- 5.69, 5.63; 6.11, 5.76 (live bacteria, dead bacteria; live algae, dead algae, Weber, Jr. et al. 1983)
 5.0 (fathead minnow, quoted, Zaroogian et al. 1985)
 4.80, 4.68 (oyster, quoted, Zaroogian et al. 1985)
 4.8–5.51 (fish, quoted, Mackay 1986; Metcalfe et al. 1988)
 5.52 (oyster, Södergren 1987)
 –1.28; –1.95; –1.77 (beef; milk; vegetable, reported as biotransfer factor $\log B_b$, $\log B_m$, $\log B_v$, Travis & Arms 1988)
 4.95, 6.65 (oyster: wet wt basis, lipid wt basis, Geyer et al. 2000)
 > 5.0, > 5.98 (fathead minnow, 32-d uptake: wet wt basis, lipid wt basis, Geyer et al. 2000)

Bioaccumulation Factor, $\log BAF$:

- 7.21 (field data, lake trout-L/kg(Ip), Thomann 1989)
 6.9, 6.51, 6.67, 6.8 (field data, large-mouth bass, L/kg(Ip), Thomann 1989)

Partition Coefficient, $\log K_p$ or $\log K_d$

- 3.21, 3.22, 4.42, 3.56 (clay: Montmorillonite, Kaolinite, natural Blue clay, stripped Blue clay, batch equilibrium-sorption isotherm, Weber, Jr. et al. 1983)
 4.38, 3.06, 4.73, 5.18, 4.55, 5.01, 4.50, 4.89, 4.05 (sediments: Saginaw River 1. natural, Saginaw River 1. stripped, Saginaw R. 2. natural, Saginaw River 2. NaOH ext., Saginaw River 2. benzene/MeOH ext., Saginaw River 2. stripped, Saginaw River 2. 12°C, Saginaw River 2. < 75 -m, Saignaw Bay, batch equilibrium-sorption isotherm, Weber, Jr. et al. 1983)
 5.06, 4.95, 5.07 (suspended solids: Huron River, Saginaw River1, Saginaw River 2, Weber, Jr. et al. 1983)

Sorption Partition Coefficient, $\log K_{oc}$:

- 6.0 (sediment/pore water 2.0% OC of pond, Halter & Johnson 1977; selected, Di Toro et al. 1985)
 5.72 (sediment, calculated- K_{ow} , Mabey et al. 1982)
 5.44 (sediment/pore water 0.7–3.8% OC-Lake Michigan, Eadie et al. 1983; selected, Di Toro et al. 1985)
 6.17, 6.16, 5.89 (clay: Montmorillonite 0.11% OC, natural Blue clay 1.82% OC, stripped Blue clay 0.47% OC, batch equilibrium-sorption isotherm, Weber, Jr. et al. 1983)
 5.84, 5.04, 6.31, 6.68, 6.29, 6.19, 6.34, 7.20 (sediments: Saginaw River 1. natural 3.45% OC, Saginaw River 1. stripped 1.05% OC, Saginaw R. 2. natural 2.61% OC, Saginaw River 2. NaOH ext. 1.98% OC, Saginaw River 2. benzene/MeOH ext. 1.84% OC, Saginaw River 2. stripped 0.67% OC, Saginaw River 2. < 75 μ m 3.51% OC, Saignaw Bay 0.07% OC, batch equilibrium-sorption isotherm, Weber, Jr. et al. 1983)
 6.10, 5.97, 6.15 (suspended solids: Huron River 9.25% OC, Saginaw River 1. 9.48% OC, Saginaw River 2. 8.30% OC, batch equilibrium, Weber, Jr. et al. 1983)
 6.65 (suspended solids/subsurface water, 56% OC-Lake Michigan, sorption isotherm, Voice & Weber 1985)
 5.88 (sediment/pore water, 0.7% OC-Lake Michigan, sorption isotherm, Voice & Weber 1985)
 5.61 (sediment/pore water, 1.7% OC-Lake Michigan, sorption isotherm, Voice & Weber 1985)
 4.82 (sediment/pore water, 3.8% OC-Lake Michigan, sorption isotherm, Voice & Weber 1985)
 6.62 (calculated, Sklarew & Girvin 1987)
 4.81 (soil, calculated-S, Chou & Griffin 1986)
 6.02 (sediment: organic carbon OC \geq 0.5%, average, Delle Site 2001)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

- Volatilization/Evaporation: volatilization rate $k \sim 2 \times 10^{-6} \text{ g cm}^{-2} \text{ d}^{-1}$ at 26°C and $k = 8.6 \times 10^{-5} \text{ g cm}^{-2} \text{ d}^{-1}$ at 60°C (Haque et al. 1974);
 $k = 0.10 \text{ } \mu\text{g m}^{-2} \text{ d}^{-1}$ with $t_{1/2} = 28 \text{ d}$ (Baker et al. 1985);
 $k = 2.7 \times 10^{-3} \text{ g m}^{-2} \text{ h}^{-1}$ (Mackay 1986; Metcalfe et al. 1988).
 Photolysis:
 Hydrolysis: not environmentally significant.

Oxidation: calculated rate constant for singlet oxygen, $k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ and, $k \ll 1 \text{ M}^{-1} \text{ h}^{-1}$ for RO_2 (peroxy radical) (Mabey et al. 1982).

Biodegradation: no reduction of concentration in the spilled transformer fluid contaminant of Aroclor was detected over a two-year period (Moein et al. 1976; quoted, Pal et al. 1980).

15.2% degraded by activated sludge in 47-h cycle (Monsanto Co. 1972);

19% degraded by activated sludge for 48-h exposure (Callahan et al. 1979);

biodegradation with a first-order $k = 0.1 \text{ d}^{-1}$ by acclimated activated sludge and $t_{1/2} = 7.0 \text{ d}$ (Callahan et al. 1979);

aerobic biodegradation $t_{1/2} = 81.9 \text{ d}$ without the addition of polymer chitin, $t_{1/2} = 36.4 \text{ d}$ with chitin and $t_{1/2} = 35.5 \text{ d}$ with chitin plus adapted microbes in flow microcosm systems with water and sedimentary materials from the field (Portier & Fujisaki 1988; quoted, Abramowicz 1990).

Biotransformation: estimated $k \sim 3 \times 10^{-9}$ to $3 \times 10^{-12} \text{ mL} \cdot \text{cell}^{-1} \cdot \text{h}^{-1}$ for bacteria transformation in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.023 \text{ d}^{-1}$ (0 to 1 d), $k_2 = 0.086 \text{ d}^{-1}$ (1 to 2 d), and $k_2 = 0.0899 \text{ d}^{-1}$ (2 to 6 d) with a biological $t_{1/2} = 5.5 \text{ d}$ (mosquito larvae, Gooch & Hamdy 1982; selected, Waid 1986)

$k_2 = 0.131 \text{ d}^{-1}$, 0.137 d^{-1} with biological $t_{1/2} = 4.7 \text{ d}$ (guppies, Gooch & Hamdy 1982; quoted, Waid 1986)

$k_2 = 0.102 \text{ d}^{-1}$ (first day), $k_2 = 0.057 \text{ d}^{-1}$ (thereafter) with a biological $t_{1/2} = 6.1 \text{ d}$ (cichlids, Gooch & Hamdy 1982; quoted, Waid 1986)

Half-Lives in the Environment:

Air:

Surface water: volatilization $t_{1/2} \sim 10 \text{ h}$ from 1 meter depth in 1 m^3 water (Mackay & Leinonen 1975; quoted, Pal et al. 1980; Mills et al. 1982).

Groundwater:

Sediment:

Soil: volatilization $t_{1/2} \sim 15 \text{ d}$ from an Ottawa sand (Haque et al. 1974; quoted, Pal et al. 1980);

$t_{1/2} > 50 \text{ d}$ in soil (Ryan et al. 1988).

Biota: $t_{1/2} < 12 \text{ d}$ in plant surface (Pal et al. 1980);

$t_{1/2} = 3.3 \text{ d}$ in guppies, and $t_{1/2} = 5.1 \text{ d}$ cichlids (Gooch & Hamdy 1982; quoted, Waid 1986).

7.1.3.7 Aroclor 1260

Common Name: Aroclor 1260

Synonym:

Chemical Name:

CAS Registry No: 11096-82-5

Molecular Formula:

Average Molecular Weight: 372–375.7

Physical State: sticky resin

Distillation Range (°C):

385–420 (NAS 1979; Brinkman & De Kock 1980)

Chlorine Content: 60%

Density (g/cm³):

1.62 (20°C, Brinkman & De Kock 1980)

1.55–1.56 (90°C, NAS 1979)

1.58 (Callahan et al. 1979; Mills et al. 1982)

1.60 (Mackay 1986; Metcalfe et al. 1988)

Molar Volume (cm³/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56$ J/mol K), F:

Water Solubility (g/m³ or mg/L at 25°C):

0.025 (Monsanto 1972)

0.025 (20°C, Nisbet & Sarofim 1972)

0.0027 (Mackay & Wolkoff 1973; quoted, Callahan et al. 1979; Geyer et al. 1980; Pal et al. 1980; Mabey et al. 1982; Mills et al. 1982; Richardson et al. 1983; Chou & Griffin 1986)

0.080 (shake flask-nephelometry, Hollifield 1979)

0.003 (quoted, Brinkman & De Kock 1980; Mackay et al. 1983; Eisenreich 1987)

0.0144 (20°C, calculated-mole fraction, Murphy et al. 1987)

Vapor Pressure (Pa at 25°C or indicated and reported temperature dependence equations):

2.67×10^{-5} (38°C, Nisbet & Sarofim 1972)

0.0054 (quoted, Mackay & Wolkoff 1973; Mackay & Leinonen 1975; Mackay et al. 1983)

0.012 (20°C, extrapolated, Monsanto 1972; NAS 1979)

$\log(P_L/\text{mmHg}) = 8.50 - 3700/(T/K)$ (temp range 150–300°C, from Monsanto 1972, NAS 1979)

0.0054 (Callahan et al. 1979; Mabey et al. 1982; Richardson et al. 1983)

0.0053 (Pal et al. 1980; Mills et al. 1982)

0.0004 (38°C, average, Wingender & Williams 1984)

0.00183, 0.00162 (GC-RT, Foreman & Bidleman 1985)

0.003 (quoted, Erickson 1986)

0.00064 (Mackay 1986; Metcalfe et al. 1988)

0.000284 (quoted, Eisenreich 1987)

0.000841 (20°C, calculated-mole fraction, Murphy et al. 1987)

Henry's Law Constant (Pa m³/mol):

722.4 (calculated, Mackay & Leinonen 1975)

718 (Slinn et al. 1978)

719 (quoted, Mills et al. 1982)

88.0 (suggested, Mackay et al. 1983)

72.24 (16°C, calculated-P/C, Richardson et al. 1983)

34.04 (calculated, Burkhard et al. 1985b; quoted, Eisenreich 1987)

21.27 (20°C, quoted, Murphy et al. 1987 from Burkhard et al. 1985b)

- 17.23 (20°C, equilibrium concn. ratio, Murphy et al. 1987)
 17.23 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)
 $\log K_{AW} = 11.848 - 4104/(T/K)$ (van't Hoff eq. derived from lit. data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 7.14 (Chiou et al. 1977)
 6.11 (Chiou et al. 1977; Callahan et al. 1979; quoted, Ryan et al. 1988)
 7.15 (Callahan et al. 1979; Mabey et al. 1982)
 6.91 (GC-RT correlation, Veith et al. 1979a; Veith & Kosian 1983; quoted, Mackay 1982; Geyer et al. 1987)
 4.34 (Pal et al. 1980)
 > 6.0 (quoted, Mills et al. 1982)
 6.30–7.50 (quoted, Mackay et al. 1983; Mackay 1986; Metcalfe et al. 1988; Eisenreich 1987)
 6.61 (calculated-S, Chou & Griffin 1986)
 6.90 (quoted, Thomann 1989)

Bioconcentration Factor, $\log BCF$:

- 5.43 (fathead minnows, DeFoe et al. 1978; quoted, Waid 1986)
 5.29 (fathead minnow, 32-d exposure, Veith et al. 1979a; Veith & Kosian 1983)
 0.672 (adipose tissue of male albino rats, Geyer et al. 1980)
 5.29, 5.59 (fish: quoted, calculated- K_{OW} , Mackay 1982)
 6.11 (microorganism, calculated- K_{OW} , Mabey et al. 1982)
 5.0–6.20 (fish, quoted, Mackay 1986; Metcalfe et al. 1988)
 2.28–2.50 (human fat of lipid basis, calculated- K_{OW} , Geyer et al. 1987)
 2.11–2.36 (human fat of wet wt. basis, calculated- K_{OW} , Geyer et al. 1987)
 4.38 (*Rhabdosargus holubi*, De Kock & Lord 1988)
 4.80, 6.72 (oyster: wet wt basis, lipid wt basis, Geyer et al. 2000)
 5.22, 6.50 (fathead minnow, male, 250-d uptake: wet wt basis, lipid wt basis, Geyer et al. 2000)
 5.43, 6.53 (fathead minnow, female, 250-d uptake, wet wt basis, lipid wt basis, Geyer et al. 2000)
 2.24, 2.40 (human, fat: wet wt basis, lipid wt basis, Geyer et al. 2000)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.83 (sediment, calculated- K_{OW} , Mabey et al. 1982)
 5.54 (soil, calculated-S, Chou & Griffin 1986)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization/Evaporation: estimated evaporation rate from liquid surfaces at 100°C to be 0.009 mg/cm²·h (Hutzinger et al. 1974);
 $t_{1/2} \sim 7.53$ h of evaporation from water depth of 1 m (Mackay & Leinonen 1975)
 rate of evaporation $k = 2.9 \times 10^{-4}$ g m⁻²·h⁻¹ (Mackay 1986; Metcalfe et al. 1988).

Photolysis:

Hydrolysis: not environmentally significant (Mabey et al. 1982).

Oxidation: calculated rate constant for singlet oxygen, $k \ll 360$ M⁻¹·h⁻¹ and $k \ll 1$ M⁻¹·h⁻¹ for RO₂ (peroxy radical) (Mabey et al. 1982).

Biodegradation: no degradation over a 12-week period in natural water samples (Oloffs et al. 1972; quoted, Pal et al. 1980).

Biotransformation: $k \sim 3 \times 10^{-9}$ to 3×10^{-12} mL·cell⁻¹·h⁻¹, transformation for bacteria in water (Mabey et al. 1982)

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 332$ d⁻¹; $k_2 = 0.014$ d⁻¹ (*Rhabdosargus holubi*, De Kock & Lord 1988)

$\log k_2 = -2.40$ d⁻¹ (fish, quoted, Thomann 1989)

Half-Lives in the Environment:

Air:

Surface water: volatilization $t_{1/2} \sim 10$ h at 1 m depth of 1 m³ of water (Mackay & Leinonen 1975; quoted, Pal et al. 1980; Mills et al. 1982).

River water: volatilization $t_{1/2} \sim 52$ d (Oloffs et al. 1972; selected, Pal et al. 1980).

Sediment:

Soil:

Biota: $t_{1/2} = 50$ d in *Rhabdosargus holubi* (De Kock & Lord 1988).

7.2 SUMMARY TABLES AND QSPR PLOTS

TABLE 7.2.5
Suggested half-life classes of polychlorinated biphenyls (PCBs) in various environmental compartments at 25°C

Compound	Air class	Water class	Soil class	Sediment class
Biphenyl	3	4	5	6
Monochloro-	4	7	8	8
Dichloro-	4	7	8	8
Trichloro-	5	8	9	9
Tetrachloro-	6	9	9	9
Pentachloro-	6	9	9	9
Hexachloro-	7	9	9	9
Heptachloro-	7	9	9	9
Octachloro-	8	9	9	9
Nonachloro-	8	9	9	9
Decachloro-	9	9	9	9

where,

Class	Mean half-life (hours)	Range (hours)
1	5	< 10
2	17 (~ 1 day)	10–30
3	55 (~ 2 days)	30–100
4	170 (~ 1 week)	100–300
5	550 (~ 3 weeks)	300–1,000
6	1700 (~ 2 months)	1,000–3,000
7	5500 (~ 8 months)	3,000–10,000
8	17000 (~ 2 years)	10,000–30,000
9	55000 (~ 6 years)	> 30,000

FIGURE 7.2.1 Molar solubility (liquid or supercooled liquid) versus Le Bas molar volume for polychlorinated biphenyls.

FIGURE 7.2.2 Vapor pressure (liquid or supercooled liquid) versus Le Bas molar volume for polychlorinated biphenyls.

8 Chlorinated Dibenzo-*p*-dioxins

CONTENTS

8.1	List of Chemicals and Data Compilations	2064
8.1.1	Dibenzo- <i>p</i> -dioxin and chlorinated dibenzo- <i>p</i> -dioxins	2064
8.1.1.1	Dibenzo- <i>p</i> -dioxin	2064
8.1.1.2	1-Chlorodibenzo- <i>p</i> -dioxin	2067
8.1.1.3	2-Chlorodibenzo- <i>p</i> -dioxin	2070
8.1.1.4	2,3-Dichlorodibenzo- <i>p</i> -dioxin	2073
8.1.1.5	2,7-Dichlorodibenzo- <i>p</i> -dioxin	2076
8.1.1.6	2,8-Dichlorodibenzo- <i>p</i> -dioxin	2080
8.1.1.7	1,2,4-Trichlorodibenzo- <i>p</i> -dioxin	2083
8.1.1.8	1,3,7-Trichlorodibenzo- <i>p</i> -dioxin	2086
8.1.1.9	2,3,7-Trichlorodibenzo- <i>p</i> -dioxin	2089
8.1.1.10	1,2,3,4-Tetrachlorodibenzo- <i>p</i> -dioxin	2092
8.1.1.11	1,2,3,7-Tetrachlorodibenzo- <i>p</i> -dioxin	2096
8.1.1.12	1,2,7,8-Tetrachlorodibenzo- <i>p</i> -dioxin	2100
8.1.1.13	1,3,6,8-Tetrachlorodibenzo- <i>p</i> -dioxin	2102
8.1.1.14	1,3,7,8-Tetrachlorodibenzo- <i>p</i> -dioxin	2107
8.1.1.15	1,3,7,9-Tetrachlorodibenzo- <i>p</i> -dioxin	2109
8.1.1.16	2,3,7,8-Tetrachlorodibenzo- <i>p</i> -dioxin	2111
8.1.1.17	1,2,3,4,7-Pentachlorodibenzo- <i>p</i> -dioxin	2119
8.1.1.18	1,2,3,7,8-Pentachlorodibenzo- <i>p</i> -dioxin	2123
8.1.1.19	1,2,4,7,8-Pentachlorodibenzo- <i>p</i> -dioxin	2126
8.1.1.20	1,2,3,4,7,8-Hexachlorodibenzo- <i>p</i> -dioxin	2128
8.1.1.21	1,2,3,6,7,8-Hexachlorodibenzo- <i>p</i> -dioxin	2133
8.1.1.22	1,2,3,7,8,9-Hexachlorodibenzo- <i>p</i> -dioxin	2136
8.1.1.23	1,2,4,6,7,9-Hexachlorodibenzo- <i>p</i> -dioxin	2139
8.1.1.24	1,2,3,4,6,7,8-Heptachlorodibenzo- <i>p</i> -dioxin	2141
8.1.1.25	1,2,3,4,7,8,9-Heptachlorodibenzo- <i>p</i> -dioxin	2146
8.1.1.26	Octachlorodibenzo- <i>p</i> -dioxin	2148

8.1 LIST OF CHEMICALS AND DATA COMPILATIONS

8.1.1 DIBENZO-*p*-DIOXIN AND CHLORINATED DIBENZO-*p*-DIOXINS

8.1.1.1 Dibenzo-*p*-dioxin

Common Name: Dibenzo-*p*-dioxin

Synonym: dibenzo-1,4-dioxin

Chemical Name: dibenzo-*p*-dioxin

CAS Registry No: 262-12-4

Molecular Formula: C₆H₄O₂C₆H₄

Molecular Weight: 184.191

Melting Point (°C):

120.5 (Lide 2003)

Boiling Point (°C):

266.0 (Rordorf 1986)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

143.82, 142.06 (calculated-liquid density, crystalline volume, Govers et al. 1990)

146.96 (liquid molar volume, Govers et al. 1995)

177.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

68.4 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

92.250 (Rordorf 1987)

93.6 (Li et al. 2004)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

23.2, 22.6 (obs., predicted, Rordorf 1986)

22.6 (Ruelle & Kesselring 1997)

23.2, 22.6 (exptl., calculated-group additivity method, Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

57 (Rordorf 1986, 1987, 1989)

58.63, 57.2 (exptl., calculated-group additivity method, Chickos et al. 1999)

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 0.116 (mp at 120.5°C)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.842*, 0.90 (generator column-HPLC/UV, generator column-GC/ECD; Shiu et al. 1988)

0.90* (generator column-GC/ECD, measured range 4–25°C, Doucette & Andren 1988a)

0.90* (generator column-GC, measured range 4–40°C, Doucette & Andren 1988a)

S/(mol/L) = 8.85 × 10⁻⁷ exp(0.067·t/°C) (generator column-GC/ECD, temp range 4–40°C, Doucette & Andren 1988a)

log x = -2541/(T/K) - 1.476; temp range 4–40°C (generator column-GC/ECD, Doucette & Andren 1988a)

ln x = 4.1680 - 6087.88/(T/K); temp range 5–50°C (regression eq. of literature data, Shiu & Ma 2000)

7.16 (GC-RI correlation, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.055* (gas saturation-GC, Rordorf 1985ab, 1986, 1987, 1989)

0.050 (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)

0.512; 0.251 (supercooled liquid P_L, quoted exptl., calculated-SOFA Solubility-parameter-based-model, Govers & Krop 1998)

log (P/Pa) = 14.91018 - 4820.43/(T/K); temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

0.389; 0.251(GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

0.107* (30°C, Knudsen effusion method, measured range 30–60°C Li et al. 2002)

$\ln(P/\text{Pa}) = (34.944 \pm 0.444) - (11259 \pm 141)/(T/\text{K})$; temp range 303–333 K (Knudsen effusion technique, Li et al. 2002, 2004)

$\ln(P/\text{Pa}) = 34.319 - 11095/(T/\text{K})$; temp range 298–398 K (regression eq. of Rordorf 1989 data, Li et al. 2004)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

12.40 (calculated-P/C, Shiu et al. 1987; 1988)

10.96 (calculated-SOFA model, Govers & Krop 1998)

15.85; 10.96 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

4.31, 4.48, 4.38; 4.38, 4.46, 4.52 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)

4.26, 4.65 (Doucette 1985)

4.17, 4.46 (HPLC-RT correlation, Sarna et al. 1984)

4.26, 4.01; 4.34, 4.17 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)

4.20 (HPLC-RT correlation, Burkhard & Kuehl 1986)

4.37 (generator column-GC, Doucette & Andren 1987)

4.18 (HPLC-RT correlation, Doucette & Andren 1988b)

4.38 (recommended, Hansch et al. 1995)

4.15 (GC-RI correlation, Wang & Wong 2002)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$ at 25°C:

Bioconcentration Factor, $\log \text{BCF}$:

4.49; 4.68 (lipid based BCF, guppy, quoted exptl., calculated-SOFA Solubility-parameter-base-model, Govers & Krop 1998)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

4.34 (sediment/water, calculated-SOFA Solubility-parameter-base-model, Govers & Krop 1998)

4.01 (derived from soot-water distribution coeff., Bärning et al. 2002)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated *data at other temperatures see reference:

$k_{\text{OH}} = 4.2 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ corresponding to an atmospheric lifetime $\tau \sim 7 \text{ h}$ at room temp. (Atkinson 1987a)

$k_{\text{OH}}(\text{calc}) = 4.0 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987b)

$k_{\text{OH}} = 37 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, calculated tropospheric lifetime $\tau = 0.4 \text{ d}$ based on the gas-phase reactions with OH radical and a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ (Atkinson 1991)

$k_{\text{OH}} = 1.48 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and the calculated tropospheric lifetime $\tau = 1.0 \text{ d}$, $k_{\text{NO}_3} = 3.9 \times 10^{-27} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated lifetime $\tau = 4.9 \text{ d}$, and $k_{\text{O}_3} < 5 \times 10^{-20} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime $\tau > 330 \text{ d}$ at $297 \pm 2 \text{ K}$ (Kwok et al. 1994)

$k_{\text{OH}}(\text{exptl}) = 14.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{calc}) = 9.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, corresponding to a tropospheric lifetime of 1.0 d (Kwok et al. 1995)

$k_{\text{OH}}^* = 12 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 345–385 K; and $k_{\text{OH}}(\text{calc}) = 9.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated atmospheric lifetime $\tau = 24 \text{ h}$ based on gas-phase OH reactions (Brubaker & Hites 1998)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: room temp. gas-phase reaction rate constant $k = 4.2 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical corresponding to an atmospheric lifetime of about 7 h (Atkinson 1987a)

tropospheric lifetime $\tau = 0.4 \text{ d}$ calculated for dibenzo-*p*-dioxin based on the gas-phase reaction with OH radical (Atkinson 1991);

tropospheric lifetimes: $\tau(\text{calc}) = 1.0 \text{ d}$, 4.9 d and >330 d for reactions with OH radical, NO_3 radical and O_3 , respectively at room temp. (Kwok et al. 1994);

tropospheric lifetime $\tau(\text{calc}) = 1.0 \text{ d}$ with respect to reaction with the OH radical (Kwok et al. 1995).

FIGURE 8.1.1.1.1 Logarithm of mole fraction solubility and vapor pressure versus reciprocal temperature for dibenzo-*p*-dioxin.

8.1.1.2 1-Chlorodibenzo-*p*-dioxin

Common Name: 1-Chlorodibenzo-*p*-dioxin

Synonym: 1-CDD, 1-MCDD

Chemical Name: 1-chlorodibenzo-*p*-dioxin

CAS Registry No: 39227-53-7

Molecular Formula: C₆H₄O₂C₆H₃Cl

Molecular Weight: 218.636

Melting Point (°C):

104.5–105.5 (Pohland & Yang 1972; quoted, Rordorf 1986,1987,1989)

Boiling Point (°C):

296.0 (Rordorf 1986)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

157.41, 158.07 (calculated-liquid density, crystalline volume, Govers et al. 1990)

156.19 (liquid molar volume, Govers et al. 1995)

197.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

76.2 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

98.55 (Rordorf 1987)

100.5 (Li et al. 2004)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

23.2, 21.4 (obs., predicted, Rordorf 1986)

23.2, 22.1 (exptl., calculated-group additivity method, Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

56.0 (Rordorf 1986,1987,1989)

61.34, 58.5 (exptl., calculated-group additivity method, Chickos et al. 1999)

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 0.164 (mp at 105.5°C)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.417* (generator column-HPLC/UV, measured range 5–45°C, Shiu et al. 1988)

ln *x* = −0.68385 − 4912.15/(T/K); temp range 5–50°C (regression eq. of literature data, Shiu & Ma 2000)

1.51 (supercooled liquid S_L, GC-RI correlation; Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.012* (gas saturation-GC, Rordorf 1985a,b, 1986,1987,1989; quoted, Shiu et al. 1988)

log (P/Pa) = 15.35327 − 5150.4/(T/K); temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

0.0275 (supercooled liquid P_L, GC-RI correlation, Wang & Wong 2002)

ln (P/Pa) = 35.353 − 11859/(T/K); temp range 298–398 K (regression eq. of Rordorf 1989 data, Li et al. 2004)

ln (P/Pa) = (36.087 ± 0.293) − (12085 ± 96)/(T/K); temp range 308–343 K (Knudsen effusion technique, Li et al. 2004)

Henry's Law Constant (Pa m³/mol at 25°C):

8.38 (calculated-P/C, Shiu et al. 1988)

6.31; 4.57 (quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

7.76; 5.75 (GC-RI correlation; calculated-SOFA, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 4.97, 5.20, 5.25; 5.05, 5.18, 5.23 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)
4.91, 5.18 (HPLC-RT correlation, Sarna et al. 1984)
4.81, 4.52; 4.91, 5.74 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)
4.75 (HPLC-RT correlation, Burkhard & Kuehl 1986)
5.05 (recommended, Hansch et al. 1995)
4.99 (GC-RI correlation; Wang & Wong 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

- 7.86*; 8.34 (generator column-GC; calculated, Harner et al. 2000)
 $\log K_{OA} = -2.88 + 3200/(T/K)$; temp range 10–40°C (Harner et al. 2000)

Bioconcentration Factor, $\log BCF$:

- 5.17; 5.08 (lipid wt base, quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.46 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 32 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, calculated tropospheric lifetime $\tau = 0.5 \text{ d}$ based on the gas-phase reactions with OH radical and a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ (Atkinson 1991)

$k_{OH}(\text{exptl}) = 4.7 \times 10^{-12} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 8.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, corresponding to a tropospheric lifetime of 1.0 d (relative rate method, Kwok et al. 1995)

Hydrolysis:

8.1.1.3 2-Chlorodibenzo-*p*-dioxin

Common Name: 2-Chlorodibenzo-*p*-dioxin

Synonym: 2-CDD, 2-MCDD

Chemical Name: 2-chlorodibenzo-*p*-dioxin

CAS Registry No: 39227-54-8

Molecular Formula: C₁₂H₈O₂Cl

Molecular Weight: 218.636

Melting Point (°C):

88–89 (Pohland & Yang 1972)

Boiling Point (°C):

298.0 (Rordorf 1986)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

154.85, 155.15 (calculated-liquid density, crystalline volume, Govers et al. 1990)

153.09 (liquid molar volume, Govers et al. 1995)

197.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

78.2 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

97.16 (Rordorf 1987)

98.1 (Li et al. 2004)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

23.1, 18.5 (obs., predicted, Rordorf 1986)

18.5 (Ruelle & Kesselring 1997)

23.1, 21.2 (exptl., calculated-group additivity method, Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

51 (Rordorf 1987, 1989)

63.78, 57.5 (exptl., calculated-group additivity method, Chickos et al. 1999)

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 0.236 (mp at 89°C)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.278*, 0.319 (generator column-HPLC/UV, generator column-GC/ECD, measured range 5–45°C, Shiu et al. 1988)

0.319* (generator column-GC/ECD, measured range 3.9–39°C, Doucette & Andren 1988a)

S/(mol/L) = 4.88 × 10⁻⁷ exp(0.048·t/°C) (generator column-GC/ECD, temp range 4–40°C, Doucette & Andren 1988a); or

log x = -1777/(T/K) - 1.566, temp range 4–40°C (generator column-GC/ECD, Doucette & Andren 1988a)

ln x = 4.093418 - 6448/(T/K); temp range 5–50°C (regression eq. of literature data, Shiu & Ma 2000)

1.44 (GC-RI correlation, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.017* (gas saturation-GC, Rordorf 1985a,b,1986,1987,1989)

0.016 (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)

log (P/Pa) = 15.2463 - 5071.88/(T/K); temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

0.0262 (GC-RI correlation, Wang & Wong 2002)

$\ln(P/\text{Pa}) = 35.106 - 11679/(T/\text{K})$; temp range 298–398 K (regression eq. of Rordorf 1989 data, Li et al. 2004)
 $\ln(P/\text{Pa}) = (35.549 \pm 0.415) - (11794 \pm 134)/(T/\text{K})$, temp range 308–343 K (Knudsen effusion technique, Li et al. 2004)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

14.82 (calculated-P/C, Shiu et al. 1988)
 12.60; 4.57 (quoted exptl., calculated-SOFA model, Govers & Krop 1998)
 7.586; 4.57 (GC-RI correlation; calculated-SOFA, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

5.36, 5.66, 5.71; 5.45, 5.64, 5.69 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)
 5.45, 5.64 (HPLC-RT correlation, Sarna et al. 1984)
 5.33, 5.00; 5.45, 5.29 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)
 5.08 (HPLC-RT correlation, Burkhard & Kuehl 1986)
 4.94 (generator column-GC/ECD, Doucette & Andren 1987)
 4.98 (HPLC-RT correlation, Doucette & Andren 1988b)
 5.45 (recommended, Hansch et al. 1995)
 5.01 (GC-RI correlation, Wang & Wong 2002)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

5.09 (guppy, Loonen et al. 1994)
 5.09; 5.12 (lipid wt base, quoted exptl., calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

3.92 (organic carbon, calculated-QSAR, Fiedler & Schramm 1990)
 5.35 (sediment/water, quoted exptl., calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$

Volatilization:

Photolysis: photodegradation $t_{1/2} = 10$ min with simulated sunlight in aerated aqueous suspension of semiconductor TiO_2 at 4.0 g/L and pH 3 (Pelizzetti et al. 1988)
 photodegradation $k = 1.81 \text{ h}^{-1}$ with $t_{1/2} = 0.38$ h when loaded on TiO_2 film under UV ($\lambda > 300$ nm) or solar light irradiation in the air (Choi et al. 2000).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}} = 32 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, calculated tropospheric lifetime $\tau = 0.5$ d for a mono-chlorinated dioxin with a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ (Atkinson 1991)

$k_{\text{OH}}(\text{exptl}) = 4.7 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{calc}) = 9.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 3.0$ d at room temp. (relative rate method, Kwok et al. 1995)

$k_{\text{OH}}(\text{calc}) = 4.1 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Brubaker & Hites 1998)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: tropospheric lifetime $\tau = 0.5$ d calculated for a mono-chlorinated dioxin based on the gas-phase reaction with OH radicals (Atkinson 1991);

calculated tropospheric lifetime for mono-chlorinated dioxin was 3.0 d for the gas-phase reaction with OH radical (Kwok et al. 1995).

first-order photodegradation $k = 1.81 \text{ h}^{-1}$ with $t_{1/2} = 0.38$ h when loaded on TiO_2 film under UV ($\lambda > 300$ nm) or solar light irradiation in the air (Choi et al. 2000).

Surface water: $t_{1/2} = 10$ min irradiated under simulated sunlight in aerated aqueous suspension of semiconductor TiO_2 at 4.0 g/L and pH 3 (Pelizzetti et al. 1988).

$\log (P/\text{Pa}) = 14.60827 - 5523.34/(T/\text{K})$ temp range 5 – 50°C (regression eq. from literature data, Shiu & Ma 2000)

0.00219 (GC-RI correlation, Wang & Wong 2002)

$\log (P_L/\text{mmHg}) = 49.61 - 6624/(T/\text{K}) - 12.569 \cdot \log (T/\text{K})$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

$\ln (P/\text{Pa}) = 33.637 - 12718/(T/\text{K})$; temp range 298 – 398 K (regression eq. of Rordorf 1989 data, Li et al. 2004)

$\ln (P/\text{Pa}) = (36.293 \pm 0.648) - (13686 \pm 245)/(T/\text{K})$; temp range 358 – 393 K (Knudsen effusion technique, Li et al. 2004)

Henry's Law Constant (Pa m³/mol at 25°C):

- 8.11 (calculated-P/C, Shiu et al. 1988)
- 6.98 (gas stripping-GC/MS, Santl et al. 1994)
- 8.13; 2.82 (quoted exptl., calculated-SOFA model, Govers & Krop 1998)
- 3.89; 2.82 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, log K_{ow}:

- 6.28, 6.64, 6.72; 6.38, 6.62, 6.71 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)
- 6.62, 6.39 (HPLC-RT correlation, Sarna et al. 1984)
- 6.27, 5.86; 6.39, 6.17 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)
- 5.75 (HPLC-RT correlation, Burkhard & Kuehl 1986)
- 6.38 (recommended, Sangster 1993)
- 6.38 (recommended, Hansch et al. 1995)
- 5.77 (GC-RI correlation, Wang & Wong 2002)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

- 8.36*; 8.67 (generator column-GC; calculated, Harner et al. 2000)
- log K_{OA} = -3.74 + 3610/(T/K); temp range 10–40°C (Harner et al. 2000)
- 8.48 (GC-retention time indices, Chen et al. 2002)

Bioconcentration Factor, log BCF:

- 1.7, 2.9 (guppy, in whole fish, in lipid, Gobas et al. 1987)
- 2.56, 3.68 (guppy: wet weight base, lipid weight base, Gobas & Schrap 1990)
- 5.37 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, log K_{oc}:

- 6.15 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k, or Half-Lives, t_{1/2}:

Volatilization:

Photolysis: photodegradation t_{1/2} = 46 min in an aqueous solution assisted by TiO₂ at 2.0 g/L under simulated sunlight (Barbeni et al. 1986)

photodegradation t_{1/2} = 1 h with irradiation under simulated sunlight in aerated aqueous suspension of semiconductor TiO₂ at 4.0 g/L and pH 3 (Pelizzetti et al. 1988)

photolysis k = 8.9 × 10⁻² min⁻¹ with t_{1/2} = 7.8 min in pure water, and rate constant k = 0.16 min⁻¹ with t_{1/2} = 4.3 min in 60% acetonitrile/water aqueous solutions at 300 nm (Kim & O'Keefe 2000).

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO₃} with NO₃ radical and k_{O₃} with O₃ or as indicated, *data at other temperatures see reference:

k_{OH}(calc) = (26–28) × 10⁻¹² cm³ molecule⁻¹ s⁻¹ at room temp. (Atkinson 1991)

k_{OH} = (22–28) × 10⁻¹² cm³ molecule⁻¹ s⁻¹, calculated tropospheric lifetime τ = 0.5–0.7 d for a di-chlorinated dioxin with a 12-h average daytime OH radical concn of 1.5 × 10⁶ molecule/cm³ (Atkinson 1991)

k_{OH}(calc) = (5.9–7.3) × 10⁻¹² cm³ molecule⁻¹ s⁻¹ with a calculated tropospheric lifetime τ = 2.0–2.4 d for a di-chlorinated DD at room temp. (relative rate method, Kwok et al. 1995)

k_{OH}(calc) = 4.1 × 10⁻¹² cm³ molecule⁻¹ s⁻¹ at 298 K (Brubaker & Hites 1998)

k_{OH}* = 23 × 10⁻¹² cm³ molecule⁻¹ s⁻¹ at 298 K, measured temp range 355–395 K, and k_{OH}(calc) = 4.1 × 10⁻¹² cm³ molecule⁻¹ s⁻¹, with a calculation lifetime τ = 65 h based on gas-phase OH reactions (Brubaker & Hites 1998)

Biodegradation:

Biotransformation: metabolic elimination k_m = 0.23 d⁻¹ (goldfish, 20°C, 96-h exposure, Sijm & Opperhuizen 1988)

Bioconcentration, Uptake (k₁) and Elimination (k₂) Rate Constants:

k₂ = 0.462 d⁻¹ (rainbow trout, Niimi & Oliver 1986; quoted, Opperhuizen & Sijm 1990)

k₁ = 390 mL g⁻¹ d⁻¹; k₂ = 0.23 d⁻¹ (goldfish, 20°C, 96-h exposure, Sijm & Opperhuizen 1988)

k₁ = 543 d⁻¹; k₂ = 1.5 d⁻¹ (guppy, Gobas & Schrap 1990)

Half-Lives in the Environment:

Air: tropospheric lifetime $\tau = 0.5\text{--}0.7$ d calculated for a di-chlorinated dioxin based on the gas-phase reaction with OH radicals (Atkinson 1991);

tropospheric calculated lifetime $\tau = 2.0\text{--}2.4$ d for the reaction with OH radical (Kwok et al. 1995);

calculated lifetime $\tau = 65$ h based on gas-phase OH reactions (Brubaker & Hites 1998).

Surface water: photodegradation $t_{1/2} = 1$ h with irradiation under simulated sunlight in aerated aqueous suspension of semiconductor TiO_2 at 4.0 g/L and pH 3 (Pelizzetti et al. 1988);

photolysis rate constant $k = 8.9 \times 10^{-2} \text{ min}^{-1}$ with $t_{1/2} = 7.8$ min in pure water, and $k = 1.6 \times 10^{-1} \text{ min}^{-1}$ with $t_{1/2} = 4.3$ min in 60% acetonitrile/water aqueous solutions at 300 nm (Kim & O'Keefe 2000).

Groundwater:

Sediment:

Soil:

Biota: mean biological $t_{1/2} \sim 2$ d in rainbow trout (Niimi 1986);

biological $t_{1/2} = 2$ d in rainbow trout (Niimi & Oliver 1986);

biological $t_{1/2} = 2\text{--}7$ d in trout (Niimi 1987).

TABLE 8.1.1.5.1

Reported aqueous solubilities, vapor pressures and octanol-air partition coefficients of 2,7-dichlorodibenzo-*p*-dioxin at various temperatures

Aqueous solubility		Vapor pressure		log K_{OA}	
Shiu et al. 1988		Rordorf 1987, 1989		Harner et al. 2000	
generator column-HPLC/UV		gas saturation-GC		generator column-GC/ECD	
t/°C	S/g·m ⁻³	t/°C	P/Pa	t/°C	log K_{OA}
5	0.00109	25	0.0001	10	9.020

FIGURE 8.1.1.5.1 Logarithm of mole fraction solubility, vapor pressure and K_{OA} versus reciprocal temperature for 2,7-dichlorodibenzo-*p*-dioxin.

8.1.1.6 2,8-Dichlorodibenzo-*p*-dioxin

Common Name: 2,8-Dichlorodibenzo-*p*-dioxin

Synonym: 2,8-TCDD

Chemical Name: 2,8-dichlorodibenzo-*p*-dioxin

CAS Registry No: 38964-22-6

Molecular Formula: $\text{ClC}_6\text{H}_3\text{O}_2\text{C}_6\text{H}_3\text{Cl}$

Molecular Weight: 253.081

Melting Point ($^{\circ}\text{C}$):

150.5–151 (Pohland & Yang 1972; Rordorf 1986,1987,1989)

Boiling Point ($^{\circ}\text{C}$):

Density (g/cm^3 at 20°C):

Molar Volume (cm^3/mol):

165.88, 167.2 (calculated-liquid density, crystalline volume, Govers et al. 1990)

160.63 (liquid molar volume, Govers et al. 1995)

218.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

84.1 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

109.01 (Rordorf 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

23.2 (Rordorf 1986, 1987; quoted, Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

55 (Rordorf 1986,1987,1989)

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$, $F: 0.058$ (mp at 151°C))

Water Solubility (g/m^3 or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.0167* (generator column-GC/ECD, measured range $5\text{--}45^{\circ}\text{C}$, Shiu et al. 1988)

$\ln x = -2.54177 - 5379/(T/\text{K})$; temp range $5\text{--}50^{\circ}\text{C}$ (regression eq. of literature data, Shiu & Ma 2000)

0.311 (supercooled liquid S_L , GC-RI correlation, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.00014* (gas saturation-GC, Rordorf 1985a,b, 1986,1987,1989)

0.00013 (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)

$\log (P/\text{Pa}) = 15.25386 - 5699.96/(T/\text{K})$; temp range $5\text{--}50^{\circ}\text{C}$ (regression eq. from literature data, Shiu & Ma 2000)

0.00219 (supercooled liquid P_L , GC-RI correlation, Wang & Wong 2002)

0.00150 (solid P_S , gas saturation-GC/MS, Mader & Pankow 2003)

0.0260 (supercooled liquid P_L , calculated from P_S assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$, Mader & Pankow 2003)

$\log (P_L/\text{mmHg}) = 49.89 - 6705/(T/\text{K}) - 12.569 \cdot \log (T/\text{K})$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

2.13 (calculated- P/C , Shiu et al. 1988)

2.14; 2.29 (quoted exptl., calculated-SOFA model, Govers & Krop 1998)

3.89; 2.29 (GC-RI correlation; calculated-SOFA, Wang & Wong 2002)

Octanol/Water Partition Coefficient, log K_{ow} :

- 4.70 (calculated, Kaiser 1983)
- 5.60 (selected, Shiu et al. 1988)
- 5.68 (calculated-SOFA model, Govers & Krop 1998)
- 5.638 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
- 5.77; 5.68 (GC-RI correlation; calculated-SOFA, Wang & Wong 2002)
- 5.34, 5.50, 5.75, 5.58 (calculated-QSPR: PLS, BPN GRNN, MOD models, Zheng et al. 2003)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

- 8.36*; 8.65 (generator column-GC; measured range 10–40°C; calculated, Harner et al. 2000)
- log $K_{OA} = -3.74 + 3610/(T/K)$; temp range 10–40°C, (Harner et al. 2000)
- 8.48 (GC-retention time indices, Chen et al. 2002)

Bioconcentration Factor, log BCF:

- 2.77, 2.82 (goldfish: treated with metabolic inhibitor PBO, untreated, Sijm & Opperhuizen 1988)
- 5.42 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, log K_{OC} :

- 6.14 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (26-28) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (22-28) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, calculated tropospheric lifetime $\tau = 0.5-0.7 \text{ d}$ for a di-chlorinated dioxin with a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ (Atkinson 1991)

$k_{OH}(\text{calc}) = (5.9-7.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 2.0-2.4 \text{ d}$ for a di-chlorinated DD at room temp. (relative rate method, Kwok et al. 1995)

Biodegradation:

Biotransformation: metabolic elimination rate constant from goldfish was estimated to be 0.35 d^{-1} (Sijm & Opperhuizen 1988).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 390 \text{ L kg}^{-1} \cdot \text{d}^{-1}$; $k_2 = 0.23 \text{ d}^{-1}$ (goldfish, Opperhuizen & Sijm 1990)

Half-Lives in the Environment:

Air: tropospheric lifetime $\tau = 0.5 - 0.7 \text{ d}$ calculated for a di-chlorinated dioxin based on the gas-phase reaction with OH radicals (Atkinson 1991);

calculated tropospheric lifetime $\tau = 2.0 - 2.4 \text{ d}$ for the reaction with OH radical. (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment:

Soil:

Biota: mean biological $t_{1/2} \sim 2 \text{ d}$ in rainbow trout (Niimi 1986);

biological $t_{1/2} = 2-7 \text{ d}$ in trout (Niimi 1987).

TABLE 8.1.1.6.1

Reported aqueous solubilities, vapor pressures and octanol-air partition coefficients of 2,8-dichlorodibenzo-*p*-dioxin at various temperatures

Aqueous solubility		Vapor pressure		log K _{OA}	
Shiu et al. 1988		Rordorf 1987, 1989		Harner et al. 2000

8.1.1.7 1,2,4-Trichlorodibenzo-*p*-dioxin

Common Name: 1,2,4-Trichlorodibenzo-*p*-dioxin

Synonym: 1,2,4-TCDD

Chemical Name: 1,2,4-trichlorodibenzo-*p*-dioxin

CAS Registry No: 39227-58-2

Molecular Formula: $C_{12}H_5Cl_3O_2$, $C_6H_4O_2C_6HCl_3$

Molecular Weight: 287.526

Melting Point (°C):

128–129 (Pohland & Yang 1972; quoted, Rordorf 1986, 1987, 1989)

Boiling Point (°C):

375.0 (calculated, Rordorf 1986, 1987, 1989)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

179.66 (calculated-liquid density, Govers et al. 1990)

173.60 (liquid molar volume, Govers et al. 1995)

239.7 (calculated-Le Bas method at normal boiling)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

83.9 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

118.79 (Rordorf 1987)

121.0 (Li et al. 2004)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

33.9 (Rordorf 1986, 1987)

Entropy of Fusion, ΔS_{fus} (J/mol K):

67 (Rordorf 1986, 1987, 1989)

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56$ J/mol K), F: 0.0954 (mp at 129°C)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.00841* (generator column-HPLC/UV, measured range 5–45°C, Shiu et al. 1988)

0.00695 (generator column-GC/MS, Santl et al. 1994)

$\ln x = -2.4909 - 5626.95/(T/K)$; temp range 5–50°C (regression eq. of literature data, Shiu & Ma 2000)

0.091 (supercooled liquid S_L , GC-RI correlation, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.0001* (gas saturation-GC, Rordorf 1985a,b, 1986, 1987, 1989)

0.0001 (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)

$\log(P/\text{Pa}) = 16.9148 - 6235.45/(T/K)$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

0.000324 (supercooled liquid P_L , GC-RI correlation, Wang & Wong 2002)

5.07×10^{-4} (solid P_s , gas saturation-GC/MS, Mader & Pankow 2003)

5.43×10^{-3} (supercooled liquid P_L , calculated from measured P_s assuming $\Delta S_{\text{fus}} = 56$ J/mol K, Mader & Pankow 2003)

$\log(P_L/\text{mmHg}) = 47.18 - 6479/(T/K) - 12.028 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

$\ln(P/\text{Pa}) = 38.948 - 14358/(T/\text{K})$; temp range 298 – 398 K (regression eq. of Rordorf 1989 data, Li et al. 2004)
 $\ln(P/\text{Pa}) = (39.303 \pm 0.605) - (14550 \pm 221)/(T/\text{K})$; temp range 348–383 K (Knudsen effusion technique, Li et al. 2004)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

- 3.84 (calculated-P/C, Shiu et al. 1988)
- 3.64 (gas stripping-GC/MS, Santl et al. 1994)
- 3.72; 1.82 (quoted exptl., calculated-SOFA model, Govers & Krop 1998)
- 2.29; 1.82 (GC-RI correlation; calculated-SOFA, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 7.40, 7.77, 7.69; 7.47, 7.76, 7.68 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)
- 7.45, 7.76 (HPLC-RT correlation, Sarna et al. 1984)
- 7.36, 6.86; 7.45, 7.11 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)
- 6.45 (HPLC-RT correlation, Burkhard & Kuehl 1986)
- 7.47 (recommended, Hansch et al. 1995)
- 6.34 (GC-RI correlation, Wang & Wong 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

- 8.97 (GC-retention time indices, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 1.90, 3.10 (guppy, in whole fish, in lipid, Gobas et al. 1987)
- 2.82, 3.95 (guppy: wet weight base, lipid weight base, Gobas & Schrap 1990)
- 5.42 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, $\log K_{oc}$:

- 7.01 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
- 5.87 (derived from soot-water distribution coeff., Bärning et al. 2002)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

k (oxidative degradation rate of water dissolved PCDD by ozone) is $1.27 \times 10^6 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline conditions at pH 10 and 20°C (Palauscek & Scholz 1987)

$k_{OH}(\text{calc}) = (21\text{--}22) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (17\text{--}22) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, calculated tropospheric lifetime $\tau = 0.7\text{--}0.9 \text{ d}$ for a tri-chlorinated dioxin with a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ (Atkinson 1991)

$k_{OH}(\text{calc}) = (4.5\text{--}5.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 2.5\text{--}3.3 \text{ d}$ for a tri-chlorinated DD at room temp. (relative rate method, Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_2 = 0.058 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1986; quoted, Opperhuizen & Sijm 1990)
- $k_1 = 601 \text{ d}^{-1}$; $k_2 = 0.91 \text{ d}^{-1}$ (guppy, Gobas & Schrap 1990)

Half-Lives in the Environment:

Air: tropospheric lifetime $\tau = 0.7\text{--}0.9 \text{ d}$ calculated for a tri-chlorinated dioxin based on the gas-phase reaction with OH radical (Atkinson 1991); the calculated tropospheric lifetime $\tau = 2.5\text{--}3.3 \text{ d}$ for the gas phase reaction with OH radical (Kwok et al. 1995).

Surface water:

Groundwater: oxidative degradation rate of water dissolved PCDD by ozone $k = 1.27 \times 10^6 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline conditions at pH 10 and 20°C (Palauscek & Scholz 1987).

Sediment:

Soil:

Biota: mean biological $t_{1/2} \sim 10$ d in rainbow trout (Niimi 1986); $t_{1/2} = 12$ d in rainbow trout (Niimi & Oliver 1986);biological $t_{1/2} = 12$ d in trout (Niimi 1987)**TABLE 8.1.1.7.1****Reported aqueous solubilities and vapor pressures of 1,2,4-trichlorodibenzo-*p*-dioxin at various temperatures**

8.1.1.8 1,3,7-Trichlorodibenzo-*p*-dioxin

Common Name: 1,3,7-Trichlorodibenzo-*p*-dioxin

Synonym: 1,3,7-TCDD

Chemical Name: 1,3,7-trichlorodibenzo-*p*-dioxin

CAS Registry No: 67026-17-5

Molecular Formula: $C_{12}H_5Cl_3O_2$, $ClC_6H_3O_2C_6H_2Cl_2$

Molecular Weight: 287.526

Melting Point ($^{\circ}C$):

148.5 (Rordorf 1986, 1987, 1989)

Boiling Point ($^{\circ}C$):

398 (calculated, Rordorf 1986, 1987, 1989)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

170.18 (liquid molar volume, Govers et al. 1995)

239.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

86.4 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

116.2 (Rordorf 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

28.4 (Rordorf 1986, 1987)

30.8, 25.7 (reported exptl., calculated, Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

67 (Rordorf 1986, 1987, 1989)

73.04, 61.0 (reported exptl., calculated, Chickos 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S = 56$ J/mol K), F: 0.0614 (mp at $148.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0974 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

0.0997; 0.0974 (supercooled liquid S_L , GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

3.60×10^{-5} * (gas saturation-GC, Rordorf 1985a,b, 1986, 1987, 1989)

3.63×10^{-4} (supercooled liquid P_L , GC-RI correlation, Wang & Wong 2002)

$\log(P_L/mmHg) = 48.01 - 6714/(T/K) - 12.028 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

1.48 (calculated-SOFA model, Govers & Krop 1998)

2.34, 1.48 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.19 (calculated-SOFA model, Govers & Krop 1998)

6.31; 6.19 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Air Partition Coefficient, log K_{OA} :

Bioconcentration Factor, log BCF:

5.55 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, log K_{OC} :

6.85 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

k (oxidative degradation rate of water dissolved PCDD by ozone) is $1.27 \times 10^6 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline conditions at pH 10 and 20°C (Palaushek & Scholz 1987)

$k_{OH}(\text{calc}) = (21\text{--}22) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (17\text{--}22) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, calculated tropospheric lifetime $\tau = 0.7\text{--}0.9 \text{ d}$ for a tri-chlorinated dioxin with a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ (Atkinson 1991)

$k_{OH}(\text{calc}) = (4.5\text{--}5.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 2.5\text{--}3.3 \text{ d}$ for a tri-chlorinated DD at room temp. (relative rate method, Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: tropospheric lifetime $\tau = 0.7\text{--}0.9 \text{ d}$ calculated for a tri-chlorinated dioxin based on the gas-phase reaction with OH radicals (Atkinson 1991); the calculated tropospheric lifetime $\tau = .5\text{--}3.3 \text{ d}$ for the gas phase reaction with OH radical. (Kwok et al. 1995).

Surface water:

Groundwater: oxidative degradation rate of water dissolved PCDD by ozone $k = 1.27 \times 10^6 \text{ L} \cdot \text{g}^{-1} \cdot \text{min}^{-1}$ under alkaline conditions at pH 10 and 20°C (Palaushek & Scholz 1987).

0.00047* (generator column-GC/ECD, measured range 4–40°C, Doucette & Andren 1988a)

S/(mol/L) = 2.75 × 10⁻¹⁰ exp(0.065·t/°C) (generator column-GC/ECD, temp range 4–40°C, Doucette & Andren 1988a); or

log x = -2447/(T/K) - 2.373, temp range 4–40°C (generator column-GC/ECD, Doucette & Andren 1988a)

0.000388 (generator column-GC/MS, Santl et al. 1994)

ln x = -10.5076 - 3984/(T/K); temp range 5–50°C (regression eq. of literature data, Shiu & Ma 2000)

0.0165 (supercooled liquid S_L, GC-RI correlation, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.0000064* (gas saturation-GC, Rordorf 1985a,b, 1986, 1987, 1989)

1.00 × 10⁻⁵ (gas saturation, estimated from vapor pressure vs. temperature plot, Rordorf et al. 1986)

1.04 × 10⁻⁴ (supercooled liquid P_L, GC-RT correlation, Eitzer & Hites 1988, 1991)

6.30 × 10⁻⁶ (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)

6.37 × 10⁻⁴ (corrected supercooled liquid P_L, GC-RT correlation, Eitzer & Hites 1998)

2.48 × 10⁻⁶ (solid vapor pressure calculated from reported P_L, Delle Site 1997)

log (P/Pa) = 15.59851 - 6199.79/(T/K); temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

2.75 × 10⁻⁵ (supercooled liquid P_L, GC-RI correlation, Wang & Wong 2002)

2.26×10^{-5} (solid P_s , gas saturation-GC/MS, Mader & Pankow 2003)

9.66×10^{-4} (supercooled liquid P_L , calculated from P_s assuming $\Delta S_{fus} = 56$ J/mol K, Mader & Pankow 2003)

$\log (P_L/\text{mmHg}) = 45.97 - 6777/(T/K) - 11.499 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

$\ln (P/\text{Pa}) = 35.917 - 14276/(T/K)$, temp range 298–398 K (regression eq. of Rordorf 1989 data, Li et al. 2004)

$\ln (P/\text{Pa}) = (33.217 \pm 0.442) - (13386 \pm 173)/(T/K)$; temp range 378–403 K (Knudsen effusion technique, Li et al. 2004)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

3.77 (calculated-P/C, Shiu et al. 1988)

2.02 (gas stripping-GC/MS, Santl et al. 1994)

3.02; 1.35 (quoted exptl., calculated-SOFA model, Govers & Krop 1998)

1.15; 1.35 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

8.65, 8.90, 8.96; 8.66, 8.91, 8.97 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)

8.64, 8.91 (HPLC-RT correlation, Sarna et al. 1984)

8.63, 8.02; 8.64, 8.07 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)

7.18, 7.08 (HPLC-RT correlation, Burkhard & Kuehl 1986)

6.20 (generator column-GC/ECD, Doucette & Andren 1987)

6.85 (HPLC-RT correlation, Doucette & Andren 1988b)

6.48 (shake flask/slow stirring method-GC/ECD, mixture from fly-ash extract, Sijm et al. 1989a)

7.18 (recommended, Sangster 1993)

7.18 (recommended, Hansch et al. 1995)

7.04 (GC-RI correlation, Wang & Wong 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

9.410 (calculated- K_{ow}/K_{aw} , Paterson et al. 1991)

9.70*; 9.86 (generator column-GC; calculated, Harner et al. 2000)

$\log K_{OA} = -4.96 + 4370/(T/K)$; temp range 10–40°C (Harner et al. 2000)

9.64 (GC-retention time indices, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

2.20, 3.40 (guppy, in whole fish, in lipid, Gobas et al. 1987)

2.90, 4.02 (guppy: wet weight base, lipid weight base, Gobas & Schrap 1990)

5.52 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

7.88 (sediment/water., calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Photolysis: solution photolysis $t_{1/2} = 1294$ min in *n*-hexadecane at 1.0 m from a GE Model RS sunlamp and surface photolysis $t_{1/2} = 560$ min on a clean glass surface under the same conditions (Nestrick et al. 1980)

sunlight induced photolysis $t_{1/2} = 380$ min in isooctane solution and sunlight induced solid phase $t_{1/2} = 65$ h of TCDD dispersed as solid films (Buser 1988);

photodegradation $t_{1/2} = 88$ h for 1,2,3,4-TCDD adsorbed to clean silica gels in a rotary photo-reactor by filtered <290 nm of light (Koester & Hites 1992);

first-order photodegradation $k = 0.98$ h⁻¹ with $t_{1/2} = 0.71$ h when loaded on TiO₂ film under UV ($\lambda > 300$ nm) or solar light irradiation in the air (Choi et al. 2000)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO₃ radical and k_{O_3} with O₃ or as indicated, *data at other temperatures see reference:

k (oxidative degradation rate of water dissolved PCDD by ozone) is 4.73×10^5 L g⁻¹ min⁻¹ under alkaline condition at pH 10 and 20°C (Palaschek & Scholz 1987)

$k_{OH}(\text{calc}) = (16 - 19) \times 10^{-12}$ cm³ molecule⁻¹ s⁻¹ at room temp. (Atkinson 1991)

$k_{\text{OH}} = (7.6 - 19) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 0.8\text{--}2.0 \text{ d}$ based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule/cm}^3$ at room temp. (Atkinson 1991)

$k_{\text{OH}}(\text{calc}) = (2.0 - 5.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 2.8\text{--}7.2 \text{ d}$ for a tri-chlorinated dioxin at room temp. (relative rate method, Kwok et al. 1995)

$k_{\text{OH}}^* = 8.5 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 306 – 366 K (Brubaker & Hites 1997)

$k_{\text{OH}}(\text{calc}) = 8 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Brubaker & Hites 1998)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.016 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1986)

$k_1 = 953 \text{ d}^{-1}$; $k_2 = 1.20 \text{ d}^{-1}$ (guppy, Gobas & Schrap 1990)

$k_1 = 35 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 > 0.23 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 66 \text{ L kg}^{-1} \text{ d}^{-1}$, $104 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for TCDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: tropospheric lifetime $\tau = 0.802.0 \text{ d}$ calculated for a tetra-chlorinated dioxin based on the gas-phase reaction with OH radicals (Atkinson 1991);

calculated tropospheric lifetime $\tau = 2.8\text{--}7.2 \text{ d}$ for the gas phase reaction with OH radical (Kwok et al. 1995);

first-order photodegradation $k = 0.98 \text{ h}^{-1}$ with $t_{1/2} = 0.71 \text{ h}$ when loaded on TiO_2 film under UV ($\lambda > 300 \text{ nm}$) or solar light irradiation in the air (Choi et al. 2000).

Surface water: sunlight induced photolysis $t_{1/2} = 380 \text{ min}$ in isooctane min and $t_{1/2} = 65 \text{ h}$ dispersed as solid films (Buser 1988).

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200 \text{ yr}$ for all homologues (estimated, Suzuki et al. 2000).

Soil: degradation $t_{1/2} = 10\text{--}100 \text{ yr}$ (estimated, Suzuki et al. 2000).

Biota: mean $t_{1/2} \sim 43 \text{ d}$ in rainbow trout (Niimi 1986);

biological $t_{1/2} = 43 \text{ d}$ in rainbow trout (Niimi & Oliver 1986);

biological $t_{1/2} = 5\text{--}14 \text{ d}$ in trout (Niimi 1987);

$t_{1/2} < 0.3 \text{ d}$ for PBO treated goldfish in 120-h exposure studies (Sijm et al. 1993)

TABLE 8.1.1.10.1

FIGURE 8.1.1.10.1 Logarithm of mole fraction solubility, vapor pressure and K_{OA} versus reciprocal temperature for 1,2,3,4-tetrachlorodibenzo-*p*-dioxin.

8.1.1.11 1,2,3,7-Tetrachlorodibenzo-*p*-dioxin

Common Name: 1,2,3,7-Tetrachlorodibenzo-*p*-dioxin

Synonym: 1,2,3,7-TCDD

Chemical Name: 1,2,3,7-tetrachlorodibenzo-*p*-dioxin

CAS Registry No: 67028-18-6

Molecular Formula: $\text{ClC}_6\text{H}_3\text{O}_2\text{C}_6\text{HCl}_3$

Molecular Weight: 321.971

Melting Point (°C):

172–175 (Friesen et al. 1985)

Boiling Point (°C):

438.3 (calculated, Rordorf 1987, 1989)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

186.52 (calculated-liquid density, Govers et al. 1990)

260.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

90.9 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

129.41 (Rordorf 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

36.6 (Rordorf 1987; quoted, Ruelle & Kesselring 1997)

25.31 (Friesen & Webster 1990)

Entropy of Fusion, ΔS_{fus} (J/mol K):

82 (Rordorf 1987, 1989)

Fugacity Ratio at 25°C (assuming $\Delta S = 56$ J/mol K), F: 0.0361 (mp at 172°C)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.00042* (20°C, ¹⁴C labeled, generator column-HPLC/LSC, measured range 20–40°C, Friesen et al. 1985)

0.00043* (20°C, generator column-HPLC/LSC, measured range 20–40°C, Webster et al. 1985)

0.00028 (20°C, ¹⁴C labeled, generator column-HPLC/LSC, Webster et al. 1986)

0.00048* (21°C, ¹⁴C-labeled, generator column-HPLC/LSC, measured range 7–41°C, Friesen & Webster 1990)

0.0161; 0.0131 (supercooled liquid S_L , GC-RI correlation, method, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1.0×10^{-6} * (predicted-vapor pressure correlation method, Rordorf 1985a,b, 1986,1989)

7.0×10^{-6} (gas saturation, estimated from vapor pressure vs. temperature plot, Rordorf et al. 1986)

5.0×10^{-6} (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)

2.69×10^{-5} (supercooled liquid P_L , GC-RI correlation, Wang & Wong 2002)

$\log (P_L/\text{mmHg}) = 46.64 - 6978/(T/K) - 11.503 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant (Pa m³/mol at 25°C):

0.77 (calculated-P/C, Shiu et al. 1988)

1.78 (calculated-SOFA model, Govers & Krop 1998)

1.15; 1.48 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, log K_{ow} :

- 8.19, 8.59, 8.81; 8.22, 8.60, 8.81 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)
 8.18, 8.60 (HPLC-RT correlation, Sarna et al. 1984)
 8.15, 7.58; 8.19, 7.72 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)
 6.91 (HPLC-RT correlation, Burkhard & Kuehl 1986)
 6.48 (shake flask/slow stirring method-GC/ECD, mixture from fly-ash extract, Sijm et al. 1989a)
 8.22 (recommended, Sangster 1993)
 8.22 (recommended, Hansch et al. 1995)
 7.05 (GC-RI correlation, Wang & Wong 2002)

Octanol/Air Partition Coefficient, log K_{OA} :

Bioconcentration Factor, log BCF:

- 3.17 (rainbow trout, steady-state, wet weight, Muir et al. 1985)
 3.44 (fathead minnow, steady-state, wet weight, Muir et al. 1985)
 3.44, 4.44 (fathead minnow, wet wt. based, lipid based, Gobas & Schrap 1990)
 3.17, 4.17 (rainbow trout, wet wt. based, lipid based, Gobas & Schrap 1990)
 3.18, 2.90 (rainbow trout, Opperhuizen & Sijm 1990)
 3.30, 3.38 (fathead minnow, Opperhuizen & Sijm 1990)
 3.09, 3.02–3.14; 3.35, 3.30–3.37 (rainbow trout, range; fathead minnow, range, De Voogt et al. 1990)
 5.50 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, log K_{OC} at 25°C or as indicated:

- 4.26 (DOC, Muir et al. 1985)
 5.39, 5.45, 5.59 (20, 30, 40°C, fulvic acid from a Manitoba soil, Webster et al. 1986)
 5.98, 5.97, 5.91 (20, 30, 40°C, humic acid from peat bog, Webster et al. 1986)
 6.55, 6.32, 6.44 (20, 30, 40°C, Aldrich humic acid, Na salt, Webster et al. 1986)
 7.87 (sediment/water., calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: $t_{1/2} = 563$ min for solution photolysis in *n*-hexadecane at 1.0 m from a GE Model RS sunlamp and
 $t_{1/2} = 156$ min for surface photolysis on a clean soft glass surface under the same conditions (Nestrick et al. 1980);

first order $k = 18.13 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 10.69$ h in water-acetonitrile (2:3 v/v) at 313 nm and the calculated midday, midseason direct sunlight photolysis first-order rate constant in aquatic bodies for various seasons: $k = 33.52 \times 10^2 \text{ d}^{-1}$ with direct sunlight photolysis $t_{1/2} = 2.08$ d in spring, $k = 39.41 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 1.77$ d in summer, $k = 21.77 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 3.20$ d in autumn, $k = 12.86 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 8.73$ d in winter, in aquatic bodies at latitude 40°N and $t_{1/2} = 8.73$ d averaged over full year (Choudhary & Webster 1986, 1989).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

k (oxidative degradation rate of water dissolved PCDD by ozone) is $4.73 \times 10^5 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline condition at pH 10 and 20°C (Palauschek & Scholz 1987)

$k_{OH}(\text{calc}) = (16\text{--}19) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (7.6\text{--}19) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime of 0.8–2.0 d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ (Atkinson 1991)

$k_{OH}(\text{calc}) = (2.0\text{--}5.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime of 2.8–7.2 d for a tetra-chlorinated dioxin at room temp. (relative rate method, Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation: rate constant $k = 0.096 \text{ d}^{-1}$ for rainbow trout (Sijm et al. 1990).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 317 \text{ d}^{-1}$; $k_2 = 0.26 \text{ d}^{-1}$ (rainbow trout, flow-through system, Muir et al. 1985)

$k_1 = 529 \text{ d}^{-1}$; $k_2 = 0.25 \text{ d}^{-1}$ (fathead minnow, flow-through system, Muir et al. 1985)
 $k_2 = 0.178, 0.163 \text{ d}^{-1}$ (rainbow trout, fathead minnow exposed to dioxins in their diets, Muir & Yarechewski 1988; quoted, Opperhuizen & Sijm 1990; Sijm et al. 1990)
 $k_1 = 420 \text{ to } 213 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.278 \text{ to } 0.250 \text{ d}^{-1}$ (rainbow trout exposed to different concentrations, quoted, Opperhuizen & Sijm 1990)
 $k_1 = 650 \text{ to } 408 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.322 \text{ to } 0.170 \text{ d}^{-1}$ (fathead minnow exposed to different concentrations, quoted, Opperhuizen & Sijm 1990)
 $k_2 = 9.5 \times 10^{-2}, 19.1 \times 10^{-2} \text{ d}^{-1}$ (metabolic inhibitor PBO-treated rainbow trout, control fish, 2–21 d exposure: Sijm et al. 1990)
 $k_1 = 35 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 > 0.23 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish after 120-h exposure, Sijm et al. 1993)
 $k_1 = 66 \text{ L kg}^{-1} \text{ d}^{-1}, 104 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for TCDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated for a tetra-chlorinated dioxin based on the gas-phase reaction with OH radical to be 0.8–2.0 d (Atkinson 1991); calculated tropospheric lifetime was 2.8–7.2 d for the gas-phase reaction with OH radical (Kwok et al. 1995).

Surface water: direct sunlight photolysis half-lives in aquatic bodies at latitude 40°N for various seasons: $t_{1/2} = 2.08 \text{ d}$ in spring, $t_{1/2} = 1.77 \text{ d}$ in summer, $t_{1/2} = 3.20 \text{ d}$ in fall, $t_{1/2} = 5.42 \text{ d}$ in winter, and $t_{1/2} = 8.73 \text{ d}$ averaged over a full year (Choudhary & Webster 1986);

$t_{1/2} = 10.69 \text{ h}$ in water-acetonitrile (2:3, v/v) at 313 nm and the calculated midday, mid-season direct phototransformation half-lives near water bodies at 40°N latitude: $t_{1/2} = 2.1 \text{ d}$ in spring, $t_{1/2} = 1.8 \text{ d}$ in summer, $t_{1/2} = 3.2 \text{ d}$ in fall and $t_{1/2} = 5.4 \text{ d}$ in winter (Choudhary & Webster 1986).

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200 \text{ yr}$ for all homologues (estimated, Suzuki et al. 2000).

Soil: degradation $t_{1/2} = 10\text{--}100 \text{ yr}$ (estimated, Suzuki et al. 2000).

Biota: elimination $t_{1/2} = 2.7 \text{ d}$ (Adams et al. 1986);

$t_{1/2} = 4 \text{ d}$ in whole body of rainbow trout (Muir & Yarechewski 1988);

$t_{1/2} < 0.3 \text{ d}$ for PBO treated gold fish in 120-h exposure studies (Sijm et al. 1993).

TABLE 8.1.1.11.1

Reported aqueous solubilities and vapor pressures of 1,2,3,7-tetrachlorodibenzo-*p*-dioxin at various temperatures

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

7.99 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: solution photolysis $t_{1/2} = 491$ min in *n*-hexadecane at 1.0 m from a GE Model RS sunlamp and surface photolysis $t_{1/2} = 350$ min on a clean glass surface under the same conditions (Nestrick et al. 1980; quoted, Mamantov 1984)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

k (oxidative degradation rate of water dissolved PCDD by ozone) is $4.73 \times 10^5 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline condition at pH 10 and 20°C (Palaushek & Scholz 1987)

$k_{OH}(\text{calc}) = 7.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (7.6\text{--}19) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 0.8\text{--}2.0$ d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule/cm}^3$ (Atkinson 1991)

$k_{OH}(\text{calc}) = (2.0\text{--}5.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 2.8\text{--}7.2$ d for a tetra-chlorinated dioxin at room temp. (relative rate method, Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 38 \text{ L kg}^{-1} \text{ d}^{-1}$; $49 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 > 0.9 \text{ d}^{-1}$; $> 0.3 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish; control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 66 \text{ L kg}^{-1} \text{ d}^{-1}$, $104 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for TCDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: tropospheric lifetime $\tau = 0.8\text{--}2.0$ d calculated for a tetra-chlorinated dioxin based on the gas-phase reaction with OH radicals (Atkinson 1991);

tropospheric lifetime $\tau(\text{calc}) = 2.8\text{--}7.2$ d for the gas-phase reaction with OH radical (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200$ yr for all homologues (estimated, Suzuki et al. 2000).

Soil: degradation $t_{1/2} = 10\text{--}100$ yr (estimated, Suzuki et al. 2000).

Biota: half-lives in gold fish: $t_{1/2} < 0.7$ d for PBO treated and $t_{1/2} < 2.1$ d for control fish in 120-h exposure studies (Sijm et al. 1993).

8.1.1.13 1,3,6,8-Tetrachlorodibenzo-*p*-dioxin

Common Name: 1,3,6,8-Tetrachlorodibenzo-*p*-dioxin

Synonym: 1,3,6,8-TCDD

Chemical Name: 1,3,6,8-tetrachlorodibenzo-*p*-dioxin

CAS Registry No: 33423-92-6

Molecular Formula: $\text{Cl}_2\text{C}_6\text{H}_2\text{O}_2\text{C}_6\text{H}_2\text{Cl}_2$

Molecular Weight: 321.971

Melting Point ($^{\circ}\text{C}$):

219–219.5 (Pohland & Yang 1972; Rordorf 1987,1989; Delle Site 1997)

Boiling Point ($^{\circ}\text{C}$):

438.3 (calculated, Rordorf 1987, 1989)

Density (g/cm^3 at 20°C):

Molar Volume (cm^3/mol):

192.34 (calculated-liquid density, Govers et al. 1990)

260.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

86.5 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

125.793 (Rordorf 1987)

118.6 (Li et al. 2004)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

36.6 (Rordorf 1987; quoted, Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

74 (Rordorf 1987, 1989)

Fugacity Ratio at 25°C (assuming $\Delta S = 56 \text{ J}/\text{mol K}$), F: 0.0125 (mp at 219°C)

Water Solubility (g/m^3 or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.00032* (20°C , ^{14}C -labeled, generator column-HPLC/LSC, measured range 20 – 40°C , Webster et al. 1985)

0.000317* (20°C , ^{14}C -labeled, generator column-HPLC/LSC, measured range 20 – 40°C , Friesen et al. 1985)

0.000283, 0.000326, 0.000366, 0.000328 (^{14}C -labeled/LSC, Milli-Q treated water, lake water, simulated lake water, Milli-Q water, Servos & Muir 1989a)

0.0322 (supercooled liquid S_L , GC-RI correlation, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

0.000537* (20°C , gas saturation, measured range 20 – 100°C , Webster et al. 1985)

7.0×10^{-7} * (predicted-vapor pressure correlation method, Rordorf 1985a,b, 1986,1987,1989)

6.76×10^{-5} (supercooled liquid P_L , GC-RI correlation, Wang & Wong 2002)

$\log (P_L/\text{mmHg}) = 46.99 - 6976/(T/K) - 11.503 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

$\ln (P/\text{Pa}) = 36.564 - 15127/(T/K)$, temp range 298 – 398 K (regression eq. of Rordorf 1989 data, Li et al. 2004)

$\ln (P/\text{Pa}) = (35.818 \pm 0.968) - (14262 \pm 380)/(T/K)$, temp range 378 – 408 K (Knudsen effusion technique, Li et al. 2004)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

6.90 (23°C , batch stripping, Webster et al. 1985)

3.77 (calculated-P/C, Shiu et al. 1988)

1.15 (calculated-SOFA model, Govers & Krop 1998)

1.48; 1.15 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, log K_{ow} :

8.72, 9.00, 9.42; 8.72, 9.02, 9.43 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)
 8.70, 9.02 (HPLC-RT correlation, Sarna et al. 1984)
 8.70, 8.08; 8.70, 8.12 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)
 7.20, 7.13 (HPLC-RT correlation, Burkhard & Kuehl 1986)
 7.13 (corrected HPLC-RT value, Burkhard & Kuehl 1986)
 6.29 (shake flask/slow stirring method-GC/MS, Sijm et al. 1989a)
 7.18 (recommended, Sangster 1993)
 6.29 (recommended, Hansch et al. 1995)
 6.79 (GC-RI correlation, Wang & Wong 2002)

Octanol/Air Partition Coefficient, log K_{OA} :

Bioconcentration Factor, log BCF:

3.03, 2.67 (fathead minnow, rainbow trout, Corbet et al. 1983, 1988)
 3.39 (rainbow trout, steady-state, wet weight basis, Muir et al. 1985)
 3.83 (fathead minnow, steady-state, wet weight basis, Muir et al. 1985)
 3.39, 3.83 (rainbow trout average, fathead minnow average, Muir et al. 1986)
 3.39, 3.32, 3.57 (*Oncorhynchus mykiss*, Servos et al. 1989)
 1.08–3.75, 2.14, 1.76–1.93 (Amphipod in lake water, in simulated lake water, in water with Aldrich humic acid, Servos & Muir 1989a)
 4.20, 4.20 (goldfish after 8 h exposure: metabolic inhibitor PBO-treated, control, Sijm et al. 1989b)
 5.00 (goldfish after 6 d exposure: metabolic inhibitor PBO-treated, Sijm et al. 1989b)
 3.76, 3.54–3.90; 3.32, 3.23–3.40 (fathead minnow, range; rainbow trout, range, De Voogt et al. 1990)
 3.83, 4.83 (fathead minnow, wet wt. based, lipid based, quoted, Gobas & Schrap 1990)
 3.39, 4.39 (rainbow trout, wet wt. based, lipid based, quoted, Gobas & Schrap 1990)
 3.46, 3.30, 3.15 (quoted, rainbow trout exposed to different concentrations, Opperhuizen & Sijm 1990)
 3.76, 3.75 (fathead minnow exposed to different concentrations, quoted, Opperhuizen & Sijm 1990)
 3.70 (10.1 ng/L for 0–10 d, predicted for biota held in lake enclosures, Servos et al. 1992b)
 3.12 (17.7 ng/L for 0–10 d, invertebrates, Servos et al. 1992b)
 3.20 (21.4 ng/L for 0–10 d, unionid clams & white suckers gill, Servos et al. 1992b)
 2.36 (3.1 ng/L for 0–10 d, white suckers carcass, Servos et al. 1992b)
 3.21 (1.6 ng/L for 14–24 d, invertebrates, Servos et al. 1992b)
 2.95 (0.9 ng/L for 14–24 d, unionid clams, Servos et al. 1992b)
 3.32 (2.1 ng/L for 14–24 d, white suckers gill, Servos et al. 1992b)
 2.70 (1.0 ng/L for 14–24 d, white suckers carcass, Servos et al. 1992b)
 4.54 (3.5 ng/L for 0–104 d, white suckers gill, Servos et al. 1992b)
 4.26 (1.8 ng/L for 0–104 d, white suckers carcass, Servos et al. 1992b)
 3.13 (gold fish, PBO-treated, 120-h exposure, Sijm et al. 1993)
 5.53 (lipid wt. base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, log K_{OC} :

4.36 (DOC, De Voogt et al. 1990)
 6.74 (calculated- K_{ow} , Corbet et al. 1988)
 2.11–3.75, 2.39, 2.05–2.38 (DOC partition coeff., lake water, simulated lake water, Aldrich humic acid, Servos & Muir 1989a)
 5.98–6.23 (sediment, Servos & Muir 1989b)
 7.50 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
 6.23 (derived from soot-water distribution coeff., Barring et al. 2002)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$, or Lifetimes, τ :

Volatilization: 3.9 d in water of 0.5 m depth in a small pond (Corbet et al. 1988)

Photolysis: solution photolysis $t_{1/2} = 507$ min in *n*-hexadecane at 1.0 m from a GE Model RS sunlamp and surface photolysis on a clean glass surface under the same conditions with $t_{1/2} = 264$ min (Nestrick et al. 1980; quoted, Muto et al. 1991);

first-order $k = 59.57 \times 10^{-6} \text{ s}^{-1}$ in water-acetonitrile (2:3, v/v) at 313 nm and calculated direct sunlight photolysis half-lives in aquatic bodies at latitude 40°N for various seasons: $t_{1/2} = 0.35$ d in spring, $t_{1/2} = 0.31$ d in summer, $t_{1/2} = 0.53$ d in fall, $t_{1/2} = 0.84$ d in winter and $t_{1/2} = 1.47$ d averaged over full year (Choudhary & Webster 1986; quoted, Muto et al. 1991)

$t_{1/2} = 14.0$ – 28.5 h in outdoor pool and $t_{1/2} = 6.3$ – 8.0 d in natural water in a Pyrex flask under sunlight (Corbet et al. 1988)

$t_{1/2} = 25$ h in water column (Corbet et al. 1983)

$t_{1/2} = 6.3$ – 8.0 d for natural water under sunlight and photodegradation $t_{1/2} = 0.3$ d in summer sunlight at 40°N and $t_{1/2} = 7$ d in a 1-L flask (Corbet et al. 1988)

photolysis $k = 59.57 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 3.24$ h in water-acetonitrile solution (2:3, v/v) at 313 nm and the calculated midday, midseason direct sunlight photolysis first-order rate constant in aquatic bodies for various seasons: $k = 198.13 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 0.35$ d in spring, $k = 226.99 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 0.31$ d in summer, $k = 130.91 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 0.53$ d in fall, $k = 82.85 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 0.84$ d in winter; while experimentally determined sunlight photolysis $t_{1/2} = 3.5$ d for ^{14}C labeled 1,3,6,8-TCDD in pond water (Choudhary & Webster 1989)

$t_{1/2} = 78.8$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation may be an important path of transformation (Corbet et al. 1988)

k (oxidative degradation rate of water dissolved PCDD by ozone) is $3.21 \times 10^5 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline condition at pH 10 and 20°C (Palauschek & Scholz 1987)

$k_{\text{OH}}(\text{calc}) = (16\text{--}19) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{\text{OH}} = (7.6\text{--}19) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 0.8$ – 2.0 d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ at room temp. (Atkinson 1991)

$k_{\text{OH}}(\text{calc}) = (2.0\text{--}5.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 2.8$ – 7.2 d for a tetra-chlorinated dioxin at room temp. (relative rate method, Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 184 \text{ d}^{-1}$; $k_2 = 0.10 \text{ d}^{-1}$ (rainbow trout, flow-through system, Muir et al. 1985)

$k_1 = 574 \text{ d}^{-1}$; $k_2 = 0.10 \text{ d}^{-1}$ (fathead minnow, Muir et al. 1985; quoted, Adams et al. 1986)

$k_1 = 225, 221, 106 \text{ d}^{-1}$ (rainbow trout fry, exposed to concn of 4, 74, 211 ng/L, 5-d uptake study, Muir et al. 1986)

$k_2 = 0.074, 0.110, 0.111 \text{ d}^{-1}$ (rainbow trout fry, exposed to 4, 74, 211 ng/L, 24 to 48-d depuration study, Muir et al. 1986)

$k_1 = 526, 621 \text{ d}^{-1}$ (fathead minnow, exposed to concn of 10, 41 ng/L, 5-d uptake study, Muir et al. 1986)

$k_2 = 0.08, 0.122 \text{ d}^{-1}$ (fathead minnow, exposed to concn of 10, 41 ng/L, 24 to 48-d depuration study, Muir et al. 1986)

$k_1 = 225, 97 \text{ L kg}^{-1} \text{ d}^{-1}$ (goldfish after 8 h exposure: metabolic inhibitor PBO-treated, control, Sijm et al. 1989)

$k_2 = 0.211 \text{ d}^{-1}$ (fathead minnow, calculated, Corbet et al. 1983; quoted, Opperhuizen & Sijm 1990)

$k_2 = 0.158 \text{ d}^{-1}$ (rainbow trout, calculated, Corbet et al. 1983; quoted, Opperhuizen & Sijm 1990)

$k_1 = 225, 221, 106 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.074, 0.110, 0.110 \text{ d}^{-1}$ (rainbow trout exposed to different concentrations in a flow system, quoted, Opperhuizen & Sijm 1990)

$k_1 = 526, 621 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.080, 0.122 \text{ d}^{-1}$ (fathead minnow exposed to different concentrations in a flow system, quoted, Opperhuizen & Sijm 1990)

$k_1 = 1200 \text{ d}^{-1}$; $k_2 = 0.06 \text{ d}^{-1}$ (filter-feeder, estimated from Muir et al. 1985 and Servos et al. 1989, Servos et al. 1992b)

$k_1 = 285 \text{ d}^{-1}$; $k_2 = 0.12 \text{ d}^{-1}$ (small fish, estimated from Muir et al. 1985 and Servos et al. 1989, Servos et al. 1992b)

$k_1 = 142, 116 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.14, > 0.24 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 66 \text{ L kg}^{-1} \text{ d}^{-1}, 104 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for TCDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: tropospheric lifetime $\tau = 0.8\text{--}2.0 \text{ d}$ calculated for a tetra-chlorinated dioxin based on the gas-phase reaction rate with OH radicals (Atkinson 1991);

calculated tropospheric lifetime $\tau = 2.8\text{--}7.2 \text{ d}$ for with OH radical (Kwok et al. 1995).

Surface water: direct sunlight photolysis in aquatic bodies at latitude 40°N for various seasons with half-lives: 0.35 d in spring, 0.31 d in summer, 0.53 d in fall, 0.84 d in winter and 1.47 d averaged over full year (Choudhary & Webster 1986);

$t_{1/2} = 14.0\text{--}28.5 \text{ h}$ for outdoor pool and $t_{1/2} = 6.3\text{--}8.0 \text{ d}$ for natural water in a Pyrex flask under sunlight (Corbet et al. 1988);

$t_{1/2} = 3.24 \text{ h}$ for photolysis in water-acetonitrile (2:3, v/v) at 313 nm and the calculated midday, mid-season direct phototransformation half-lives near water bodies at 40°N latitude calculated to be: $t_{1/2} = 0.35 \text{ d}$ in spring, $t_{1/2} = 0.31 \text{ d}$ in summer, $t_{1/2} = 0.53 \text{ d}$ in fall, and $t_{1/2} = 0.84 \text{ d}$ in winter (Choudhary & Webster 1989);

calculated transformation rate constant in simulated lake enclosure of $9.4 \times 10^{-2} \text{ h}^{-1}$ (Servos et al. 1992a).

Groundwater:

Sediment: $t_{1/2} = 51.2\text{--}69.2 \text{ d}$ (Corbet et al. 1988);

calculated $t_{1/2} = 10 \text{ yr}$ with a transformation rate constant $k = 7.9 \times 10^{-6} \text{ h}^{-1}$ (Servos et al. 1992a);

degradation $t_{1/2} = 20\text{--}200 \text{ yr}$ for all homologues (estimated, Suzuki et al. 2000).

Soil: degradation $t_{1/2} = 10\text{--}100 \text{ yr}$ (estimated, Suzuki et al. 2000).

Biota: $t_{1/2} = 4 \text{ d}$ in rainbow trout (Neely 1979; quoted, Niimi & Oliver, 1983,1986);

$t_{1/2} = 4 \text{ d}$ in rainbow trout (Corbet et al. 1983; quoted, Niimi & Oliver 1986);

$t_{1/2} = 2 \text{ d}$ in rainbow trout (Muir et al. 1984);

$t_{1/2} = 6\text{--}9 \text{ d}$ for both rainbow trout fry and fathead minnow (Muir et al. 1986);

$t_{1/2} = 6.90 \text{ d}$ in fathead minnow (Adams et al. 1986);

$t_{1/2} = 41 \text{ to } 44 \text{ d}$ in rooted vegetable (Corbet et al. 1988);

$t_{1/2} = 15 \text{ d}$ in whole body of rainbow trout (Muir et al. 1990);

half-lives in gold fish: $t_{1/2} = 4.8 \text{ d}$ for PBO treated and $t_{1/2} < 0.3 \text{ d}$ for control fish in 120-h exposure studies (Sijm et al. 1993)

TABLE 8.1.1.13.1

Reported aqueous solubilities and vapor pressures of 1,3,6,8-tetrachlorodibenzo-*p*-dioxin at various temperatures

Aqueous solubility				Vapor pressure

				$\Delta S_{\text{fus}}/(\text{J mol}^{-1} \text{ K}^{-1}) = 74$			

FIGURE 8.1.1.13.1 Logarithm of mole fraction solubility and vapor pressure versus reciprocal temperature for 1,3,6,8-tetrachlorodibenzo-*p*-dioxin.

8.1.1.14 1,3,7,8-Tetrachlorodibenzo-*p*-dioxin

Common Name: 1,3,7,8-Tetrachlorodibenzo-*p*-dioxin

Synonym: 1,3,7,8-TCDD

Chemical Name: 1,3,7,8-tetrachlorodibenzo-*p*-dioxin

CAS Registry No: 50585-46-1

Molecular Formula: $\text{Cl}_2\text{C}_6\text{H}_2\text{O}_2\text{C}_6\text{H}_2\text{Cl}_2$

Molecular Weight: 321.971

Melting Point ($^{\circ}\text{C}$):

193.5–195 (Rordorf 1986, 1987, 1989)

Boiling Point ($^{\circ}\text{C}$):

438.3 (calculated, Rordorf 1986, 1987, 1989)

Density (g/cm^3 at 20°C):

Molar Volume (cm^3/mol):

188.33 (calculated-liquid density, Govers et al. 1990)

260.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

88.9 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

127.77 (Rordorf 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

36.6 (Rordorf 1987)

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

78 (Rordorf 1986, 1987, 1989)

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$), F:

Water Solubility (g/m^3 or mg/L at 25°C):

0.0203 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

00223, 0.0203 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations.):

8.4×10^{-7} , 4.5×10^{-5} , 1.4×10^{-3} , 2.6×10^{-2} , 0.35 (25, 50, 75, 100, 125°C , predicted-vapor pressure correlation method, Rordorf 1985a,b, 1987, 1989)

8.32×10^{-5} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

4.17×10^{-5} ; 8.32×10^{-5} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

$\log(P_L/\text{mmHg}) = 46.80 - 6977/(T/\text{K}) - 11.503 \cdot \log(T/\text{K})$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

1.26 (calculated-SOFA model, Govers & Krop 1998)

1.29; 1.26 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{\text{ow}}$:

6.80 (calculated-SOFA model, Govers & Krop 1998)

6.93; 6.80 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

6.30; 6.29, 6.28, 6.40, 6.44 (observed; calculated-QSPR: PLS, BPN GRNN, MOD models, Zheng et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

5.52 (lipid wt. base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

7.72 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: solution photolysis $t_{1/2} = 153$ min in *n*-hexadecane at 1.0 m from a GE Model RS sunlamp and surface photolysis $t_{1/2} = 160$ min on a clean glass surface under the same conditions (Nestrick et al. 1980; quoted, Mamantov 1984)

$t_{1/2} = 86.6$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 13 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \cdot \text{s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (7.6 - 19) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \cdot \text{s}^{-1}$ and a calculated tropospheric lifetime $\tau = 0.8\text{--}2.0$ d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ at room temp. (Atkinson 1991)

$k_{OH}(\text{calc}) = (2.0 - 5.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \cdot \text{s}^{-1}$ with a calculated tropospheric lifetime $\tau = 2.8\text{--}7.2$ d at for a tetra-chlorinated dioxin at room temp. (relative rate method, Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 57 \text{ L kg}^{-1} \text{ d}^{-1}$; $99 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.14 \text{ d}^{-1}$; $> 0.24 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish; control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 66 \text{ L kg}^{-1} \text{ d}^{-1}$, $104 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for TCDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: tropospheric lifetime $\tau = 0.8\text{--}2.0$ d calculated for a tetra-chlorinated dioxin based on the gas-phase reaction with OH radicals (Atkinson 1991); calculated tropospheric lifetime $\tau = 2.8\text{--}7.2$ d for the gas-phase reaction with OH radical (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200$ yr for all homologues (estimated, Suzuki et al. 2000).

Soil: degradation $t_{1/2} = 10\text{--}100$ yr (estimated, Suzuki et al. 2000).

Biota: half-lives in gold fish: $t_{1/2} = 2.1$ d for PBO treated and $t_{1/2} < 0.4$ d for control fish in 120-h exposure studies (Sijm et al. 1993).

8.1.1.15 1,3,7,9-Tetrachlorodibenzo-*p*-dioxin

Common Name: 1,3,7,9-Tetrachlorodibenzo-*p*-dioxin

Synonym: 1,3,7,9-TCDD

Chemical Name: 1,3,7,9-tetrachlorodibenzo-*p*-dioxin

CAS Registry No: 62470-53-5

Molecular Formula: $\text{Cl}_2\text{C}_6\text{H}_2\text{O}_2\text{C}_6\text{H}_2\text{Cl}_2$

Molecular Weight: 321.971

Melting Point ($^{\circ}\text{C}$):

Boiling Point ($^{\circ}\text{C}$):

Density (g/cm^3 at 20°C):

Molar Volume (cm^3/mol):

192.34 (calculated-liquid density, Govers et al. 1990)

260.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

123.6 (Li et al. 2004)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($\text{J}/\text{mol K}$):

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56 \text{ J}/\text{mol K}$), F:

Water Solubility (g/m^3 or mg/L at 25°C):

0.0294 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

00294, 0.0294 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations):

5.50×10^{-5} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

5.89×10^{-5} ; 5.50×10^{-5} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

$\log(P_L/\text{mmHg}) = 46.86 - 6956/(T/\text{K}) - 11.503 \cdot \log(T/\text{K})$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

$\ln(P/\text{Pa}) = (37.221 \pm 0.469) - (14864 \pm 185)/(T/\text{K})$; temp range 383–408 K (Knudsen effusion technique, Li et al. 2004)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

0.589 (calculated-SOFA model, Govers & Krop 1998)

1.42; 0.589 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.39 (shake flask/slow stirring-GC/MS, mixture of fly ash extract, Sijm et al. 1989)

6.68 (calculated-SOFA model, Govers & Krop 1998)

6.83; 6.68 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

6.28, 6.12, 6.47, 6.44 (calculated-QSPR: PLS, BPN GRNN, MOD models, Zheng et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log \text{BCF}$:

5.67 (lipid wt. base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

7.51 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: solution photolysis $t_{1/2} = 499$ min in *n*-hexadecane at 1.0 m from a GE Model RS sunlamp and surface photolysis $t_{1/2} = 169$ min on a clean glass surface under the same conditions (Nestrick et al. 1980; quoted, Mamantov 1984)

$t_{1/2} = 79.7$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (16 - 19) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (7.6 - 19) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 0.8\text{--}2.0$ d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ at room temp. (Atkinson 1991)

$k_{OH}(\text{calc}) = (2.0\text{--}5.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 2.8\text{--}7.2$ d for a tetra-chlorinated dioxin at room temp. (relative rate method, Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 54 \text{ L kg}^{-1} \text{ d}^{-1}$, $98 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 < 0.1 \text{ d}^{-1}$, $> 2.1 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish; control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 66 \text{ L kg}^{-1} \text{ d}^{-1}$, $104 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for TCDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: tropospheric lifetime $\tau = 0.8\text{--}2.0$ d calculated for a tetra-chlorinated dioxin based on the gas-phase reaction with OH radicals (Atkinson 1991); calculated tropospheric lifetime $\tau = 2.8\text{--}7.2$ d for the gas-phase reaction with OH radical (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200$ yr for all homologues (estimated, Suzuki et al. 2000).

Soil: degradation $t_{1/2} = 10\text{--}100$ yr (estimated, Suzuki et al. 2000).

Biota: half-lives in gold fish: $t_{1/2} > 7$ d for PBO treated and $t_{1/2} < 0.3$ d for control fish in 120-h exposure studies (Sijm et al. 1993).

8.1.1.16 2,3,7,8-Tetrachlorodibenzo-*p*-dioxin

Common Name: 2,3,7,8-Tetrachlorodibenzo-*p*-dioxin

Synonym: 2,3,6,7-tetrachlorodibenzo-*p*-dioxin, TCDD, TCDBD, 2,3,6,7- TCDD, 2,3,7,8-TCDD, dioxin

Chemical Name: 2,3,7,8-tetrachlorodibenzo-*p*-dioxin

CAS Registry No: 1746-01-6

Molecular Formula: $\text{Cl}_2\text{C}_6\text{H}_2\text{O}_2\text{C}_6\text{H}_2\text{Cl}_2$

Molecular Weight: 321.971

Melting Point (°C):

295 (Lide 2003)

Boiling Point (°C):

421.2 (Schroy et al. 1985a)

Density (g/cm³ at 20°C):

1.827 (solid at 25°C, Boer et al. 1972; Schroy et al. 1985a)

1.021 (liquid at normal boiling point, Schroy et al. 1985a)

Molar Volume (cm³/mol):

184.32, 184.97 (calculated-liquid density, crystalline volume, Govers et al. 1990)

188.34 (liquid molar volume, Govers et al. 1990)

260.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

71.71 (at normal bp, Schroy et al. 1985a)

79.9 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

123.91 (Schroy et al. 1985b)

124.001 (Rordorf 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

38.91 (Boer et al. 1972; Schroy et al. 1985a,b; Ruelle & Kesselring 1997)

38.9, 36.6 (Obs., predicted, Rordorf 1986, 1987)

Entropy of Fusion, ΔS_{fus} (J/mol K):

69 (Rordorf 1986, 1987, 1989)

Fugacity Ratio at 25°C (assuming $\Delta S_{\text{fus}} = 56$ J/mol K), F: 0.00244 (mp at 295°C)

0.0017 (Shiu et al. 1988)

4.07×10^{-4} (calculated, Passivirta et al. 1999)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations):

0.0002 (shake flask-GC/ECD, Crummett & Stehl 1973)

3.17×10^{-4} (¹⁴C-labeled, generator column-HPLC/LSC, Webster et al. 1983)

1.93×10^{-5} (shake flask-GC/MS, Marple et al. 1986a)

7.91×10^{-6} (¹⁴C-labeled, Adams & Blaine 1986)

1.29×10^{-5} , 4.83×10^{-4} (4.3, 17.3°C, generator column-GC/MS, Lodge 1989)

$\log [S_L/(\text{mol/L})] = 0.190 - 2089/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

0.0158 (supercooled liquid S_L , GC-RI correlation, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1.0×10^{-7} (¹⁴C-gas saturation method, Jaber & Podoll 1983)

$(4.50 \pm 2) \times 10^{-6}$ (gas saturation-GC, Rordorf 1985a)

$(3.5-6.3) \times 10^{-6}$, $(1.3-3.1) \times 10^{-4}$, $(2.8-8.9) \times 10^{-2}$, $(3.9-15.9) \times 10^{-2}$, $(4.4-21.9) \times 10^{-1}$ (25, 50, 75, 100, 125°C, predicted using estimated ΔH_{sub} and ΔS_{sub} for tetra-chloro isomers, Rordorf 1985a)

$4.61 \times 10^{-7*}$ (30.1°C, gas saturation-GC/MS, measured range 30.1–71.1°C Schroy et al. 1985a,b)

$\log (P/\text{mmHg}) = 12.89784 - 6477.132/(273.15 + t/^\circ\text{C})$; temp range 10–305°C (Antoine eq., from gas saturation-GC/MS, Schroy et al. 1985b)

$\log (P/\text{mmHg}) = 8.78307 - 4098.173/(273.15 + t/^{\circ}\text{C})$; temp range 305–420 $^{\circ}\text{C}$ (Antoine eq., from gas saturation-GC/MS, Schroy et al. 1985b)
 $2.02 \times 10^{-7*}$, 4.60×10^{-7} , 9.65×10^{-6} , 4.58×10^{-5} , 1.59×10^{-4} (25, 30, 50, 62, 71 $^{\circ}\text{C}$, results derived from Antoine eq., gas saturation-GC/MS, Schroy et al. 1985b)
 $\ln (P/\text{Pa}) = 34.570834 - [14903.438/(T/\text{K})]$, temp range: 283.15–578.15 K (gas saturation, Schroy et al. 1985a)
 $\ln (P/\text{Pa}) = 25.104351 - 93430.391/(T/\text{K})$, temp range: 578.15–703.15 K (gas saturation, Schroy et al. 1985a)
 $8.71 \times 10^{-6*}$ (20 $^{\circ}\text{C}$, gas saturation-LSC, measured range 20–100 $^{\circ}\text{C}$, Webster et al. 1985)
 9.87×10^{-8} (^{14}C -gas saturation, Podoll et al. 1986)
 8.14×10^{-8} , 6.0×10^{-5} (20 $^{\circ}\text{C}$, quoted: solid P_s , supercooled liquid P_L , Bidleman & Foreman 1987)
 $2.0 \times 10^{-7*}$ (gas saturation-GC, measured range 25–125 $^{\circ}\text{C}$, Rordorf 1987, 1989)
 6.20×10^{-7} , 2.6×10^{-5} , 6.1×10^{-4} , 9.7×10^{-3} , 1.1×10^{-1} (25, 50, 75, 100, 125 $^{\circ}\text{C}$, predicted-vapor pressure correlation method, Rordorf 1987, 1989)
 6.17×10^{-4} ; 2.51×10^{-7} (supercooled liquid P_L ; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)
 $\log (P_s/\text{Pa}) = 12.66 - 5739/(T/\text{K})$ (solid, Passivirta et al. 1999)
 $\log (P_L/\text{Pa}) = 9.05 - 3663/(T/\text{K})$ (supercooled liquid, Passivirta et al. 1999)
 1.17×10^{-4} ; 5.75×10^{-5} (supercooled liquid P_L , quoted exptl., calculated-SOFA model, Govers & Krop 1998)
 $\log (P_s/\text{Pa}) = 15.0391 - 6482.7/(T/\text{K})$; temp range 5–50 $^{\circ}\text{C}$ (regression eq. from literature data, Shiu & Ma 2000)
 5.25×10^{-4} (supercooled liquid P_L , Harner et al. 2000)
 2.57×10^{-5} ; 5.75×10^{-5} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)
 5.56×10^{-7} (solid P_s , gas saturation-GC/MS, Mader & Pankow 2003)
 3.35×10^{-4} (supercooled liquid P_L , calculated from P_s assuming $\Delta S_{\text{fus}} = 56 \text{ J/mol K}$, Mader & Pankow 2003)
 $\log (P_L/\text{mmHg}) = 49.89 - 6705/(T/\text{K}) - 12.569 \cdot \log (T/\text{K})$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25 $^{\circ}\text{C}$ and reported temperature dependence equations):

0.0021 (calculated-P/C, Mabey et al. 1982)
 0.152 (calculated-P/C, Crosby 1985)
 0.212 (calculated-P/C, Schroy et al. 1985)
 1.64 (calculated-P/C, Podoll et al. 1986)
 1.63, 3.34, 10.34 (calculated-P/C, Shiu et al. 1988)
 7.93 (calculated-P/C, Jury et al. 1990)
 1.62 (calculated-SOFA model, Govers & Krop 1998)
 $\log [H/(\text{Pa m}^3/\text{mol})] = 8.86 - 1574/(T/\text{K})$ (Passivirta et al. 1999)
 1.12; 1.62 (GC-RI correlation; calculated-SOFA, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

5.38 (Crummett & Stehl 1973)
 6.19 (Neely 1979; Veith et al. 1979; Corbet et al. 1983)
 6.15 (Kenaga 1980;)
 8.93 (HPLC-RT correlation, Sarna et al. 1984)

 6.42 (shake flask/slow stirring method-GC/MS, Sijm et al. 1989a)
 7.02 (recommended, Sangster 1993)
 6.53 (recommended, Hansch et al. 1995)
 7.06 (GC-RI correlation, Wang & Wong 2002)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$ at 25 $^{\circ}\text{C}$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

9.70 (calculated- $K_{\text{OW}}/K_{\text{AW}}$, Wania & Mackay 1996)
 10.05*; 9.91 (generator column-GC; calculated, Harner et al. 2000)
 11.04 (7 $^{\circ}\text{C}$, GC-retention time correlation, Harner et al. 2000)
 $\log K_{\text{OA}} = -6.19 + 4840/(T/\text{K})$; temp range 10–50 $^{\circ}\text{C}$ (generator column-GC/ECD, Harner et al. 2000)
 9.95 (GC-retention time indices correlation, Chen et al. 2002)

Bioconcentration Factor, log BCF:

- 1.69, 2.34, 2.08 (*daphnia*, ostracod, brine shrimp, ^{14}C -labeled-LSC, Matsumura & Benezet 1973)
 4.30–4.41; 3.6–3.95 (snail, *gambusia*, *daphnids*; duckweed, algae, catfish; Isensee & Jones 1975)
 3.96 (rainbow trout, Branson et al. 1985)
 3.90 (fathead minnow, steady-state, wet weight, Adams et al. 1986)
 3.73, 4.55 (fish: flowing water test, static ecosystem test, Kenaga & Goring 1980, Kenaga 1980)
 3.97 (rainbow trout, Branson et al. 1983)
 3.97, 3.67 (rainbow trout: whole body, muscle, Branson et al. 1985)
 1.38–1.60 (rhesus monkey, Geyer et al. 1986)
 4.11 (guppy, Opperhuizen et al. 1986)
 4.43, 4.59 (rainbow trout: measured average, estimated BCF at steady-state, for 28-d exposure, Mehrle et al. 1988)
 4.30, 5.0 (goldfish after 8 h exposure: metabolic inhibitor PBO-treated, control, Sijm et al. 1989b)
 3.89, 4.59 (fathead minnow, rainbow trout, De Voogt et al. 1990)
 5.80, 5.90 (goldfish after 6 d exposure: PBO-treated, control, Sijm et al. 1989b)
 4.11, 5.64 (guppy, wet wt. based, lipid based, quoted, Gobas & Schrap 1990)
 3.97, 4.70; 4.97, 5.70 (rainbow trout, wet wt. based, lipid based, quoted, Gobas & Schrap 1990)
 4.63, 4.40 (pine needle/air BCF values, Reissinger et al. 1989)
 4.59, 4.58, 4.93, 4.57, 3.97 (rainbow trout, quoted, Opperhuizen & Sijm 1990)
 4.11, 3.90, 3.78 (guppy, fathead minnow, mosquito fish, quoted, Opperhuizen & Sijm 1990)
 2.62 (human, Webster & Connett 1991)
 5.24; 4.91 (guppies, 21-d exposure, lipid wt: system I - absence of sediment; system II - with presence of sediment, Loonen et al. 1994a)
 5.24; 4.83; 5.02 (guppies, 21-d exposure, lipid wt basis: measured- $C_{\text{fish}}/C_{\text{W}}$; calculated; rate constant ratio k_1/k_2 from non-linear regression analysis, Loonen et al. 1994b)
 5.24; 5.48 (lipid wt. base, quoted exptl., calculated-SOFA model, Govers & Krop 1998)
 5.71, 6.71 (fish medaka 10% lipid: BCF_{W} , BCF_{L} , Geyer et al. 2000)
 6.02, 6.05 (fish muscle log BCF_{L} calculated from water, calculated from sediment, Wu et al. 2001)

Sorption Partition Coefficient, log K_{OC} :

- 5.67 (organic carbon soil, calculated- K_{OW} , Kenaga 1980)
 6.95, 7.39–7.58 (calculated- K_{OW} , 10 soils from Missouri & New Jersey, Jackson et al. 1985)
 6.22–6.54; 5.96–6.09 (red clay soil from Missouri, Alluvial soil from Missouri, Marple et al. 1986)
 4.83 (hydroxy aluminum-clay, Srinivasan & Fogler 1987)
 6.60 (^{14}C -labeled, soil, batch equilibrium-sorption isotherm, GC/ECD, Walters & Guiseppi-Elie 1988)
 3.06 (soil, Eduljee 1987)
 6.30; 7.59; 7.25 (Lake Ontario sediment; solids; DOC dissolved organic carbon; batch equilibrium-sorption isotherm, Lodge & Cook 1989)
 6.24, 6.10, 5.10 (Eglin Air Force Base soil/water with 0.01% surfactant from Florida at pH 4, 7, 8.5, batch equilibrium-GC, Puri et al. 1989)
 6.50, 5.86, 4.81 (Time Beach soil/water with 0.01% surfactant from Missouri at pH 4, 7, 8.5, Puri et al. 1989)
 5.70, 5.09, 4.76 (Visalia soil/water with 0.01% surfactant from California at pH 4, 7, 8.5, Puri et al. 1989)
 6.44, 6.66 (batch equilibrium-sorption isotherms: 2-d, 10-d isotherm, regression analysis for sorption of uncontaminated Time Beach soil from water, Walters et al. 1989)
 6.14 (soil, Jury et al. 1990)
 6.80 (Baltic sea particulate filed samples, concn distribution-GC/MS, Broman et al. 1991)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization: probably not an important process (Callahan et al. 1979)

$t_{1/2} = 20\text{--}200$ d from water column which will be slowed down further by the fact that it is sorbed to the sediment and biota (Mill 1985)

$t_{1/2} \sim 32$ d for ponds and $t_{1/2} \sim 16$ d for rivers (Podoll et al. 1986)

$t_{1/2} = 104$ d from soil by calculation assuming diffusion of TCDD in soil is vapor-dominated up to volumetric water content of $0.3 \text{ m}^3/\text{m}^3$, and then liquid-dominated to saturation (Eduljee 1987)

$t_{1/2} = 190$ d (Thibodeaux & Lipsky 1985; quoted, Eduljee 1987)

$t_{1/2} = 365$ d for volatilization from below surface soil (Jury et al. 1990)

$k = 0.0054 \text{ h}^{-1}$ with $t_{1/2} = 128$ h from grass foliage (McCrary & Maggard 1993)

Photolysis:

stable to sunlight for at least 14 d in distilled water (Crosby et al. 1971; quoted, Dougherty et al. 1991)

$t_{1/2} = 3$ h in methanol solution in sunlight (Plimmer et al. 1973)

$t_{1/2} = 56$ min for vapor in sunlight (Peterson 1976; quoted, Mill 1985)

thin film of TCDD on glass plates showed transformation at about 6 h (Crosby & Wong 1977);

$t_{1/2}(\text{soln}) = 56.8$ min in *n*-hexadecane on a clean soft glass surface at 1.0 m from a GE Model RS sunlamp and surface photolysis $t_{1/2} = 140$ h on a clean glass surface under the same conditions (Nestrick et al. 1980; quoted, Mamantov 1984; Dougherty et al. 1991)

TCDD extracted from the aqueous sludge with hexane can be continuously degraded by a mercury arc of UV radiation (Exner et al. 1982; quoted, Crosby 1985)

$t_{1/2} \sim 1$ d in water, $t_{1/2} = 0.1$ d in vapor and $t_{1/2} = 1\text{--}100$ d in soil with $t_{1/2} = 50$ d for a small fraction in water column in equilibrium with sediment sorbed with TCDD (Mill 1985)

$k_p = 6.94 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 27$ h in a 90:10 mixture of distilled water and acetonitrile under summer sunlight; $k_p = 0.15 \text{ d}^{-1}$ with $t_{1/2} = 6$ d in summer sunlight at 40°L surface waters (Dulin et al. 1986)

$t_{1/2} = 81$ h after adjusting for relative winter sunlight intensity (Lyman et al. 1982; quoted, Howard et al. 1991)

$k = 0.14 \text{ d}^{-1}$ with $t_{1/2} = 118$ h in winter, $k = 0.61 \text{ d}^{-1}$ with $t_{1/2} = 27$ h in spring, $k = 0.78 \text{ d}^{-1}$ with $t_{1/2} = 21$ h in summer, and $k = 0.32 \text{ d}^{-1}$ with $t_{1/2} = 51$ h in autumn for aqueous dissolved TCDD in sunlight over four seasons at 40°N latitude (Podoll et al. 1986)

photodegradation $t_{1/2} = 10$ min, a very rapid process at soil surface during the day (Facchetti et al. 1986)

$t_{1/2} = 14$ min sunlight induced photolysis in isooctane solution and sunlight induced solid phase $t_{1/2} = 300$ h dispersed as solid films (Buser 1988)

$k = 5.9 \times 10^{-3} \text{ s}^{-1}$ rate constant for photolysis in air at 150–350°C (Orth et al. 1989)

$k = 0.15 \text{ min}^{-1}$ first-order photolysis rate constant in isooctane and over 90% was lost in 21 min of irradiation in isooctane whereas only greater than 55% TCDD remained in soil after 15 d of irradiation (Kieatiwong et al. 1990)

photolytic degradation $t_{1/2} = 4.5$ h in extract from fly ash exposed to UV light from a distance of 20 cm for native congener and $t_{1/2} = 5.2$ h for ^{13}C -labeled congener in tetradecane solution (Tysklind & Rappe 1991)

$t_{1/2} = 31$ min in hexadecane and $t_{1/2} = 27$ min in ethyl oleate (Dougherty et al. 1991)

photodegradation $k = 0.0156 \text{ h}^{-1}$ with $t_{1/2} = 44$ h for TCDD sorbed to grass foliage and exposed to natural sunlight (McCrary & Maggard 1993)

$t_{1/2} = 52$ h, direct sunlight photolysis in water-acetonitrile in midday of mid-summer at 40°N (quoted, Zepp 1991)

$t_{1/2} = 55.5$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k = 6 \times 10^{-7} \text{ s}^{-1}$ with $t_{1/2} = 320$ h, estimated for the reaction with 3×10^{-15} mole OH radicals in vapor phase (Singh 1977; quoted, Mill 1985)

laboratory tests shown that 99.5% TCDD was oxidized in 21 s at 800°C while only 50% reacted at 700°C (Esposito et al. 1980; quoted, Crosby 1985)

$k_{\text{OH}} = 2 \times 10^8 \text{ mol}^{-1} \text{ s}^{-1}$ with $t_{1/2} = 13$ d for oxidation in vapor phase (Mill 1985)

$k_{\text{OH}} > 1.0 \times 10^8 \text{ mol}^{-1} \text{ s}^{-1}$, $1.7 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with $t_{1/2} = 200$ h (Podoll et al. 1986)

$k_{\text{OH}}(\text{calc}) = 9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with an atmospheric lifetime $\tau \sim 3$ d (Atkinson 1987a)

$k_{\text{OH}}(\text{calc}) = 8.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship Atkinson 1987b) photooxidation $t_{1/2} = 22.3\text{--}223$ h, based on estimated rate constant for reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991)

$k = 1.33 \times 10^5 \text{ L g}^{-1} \text{ min}^{-1}$, the oxidative degradation of water dissolved TCDDs by ozone takes place only under alkaline conditions at pH 10 and 20°C (Palauscek & Scholz 1987)

$k_{\text{OH}}(\text{calc}) = 7.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{\text{OH}} = (7.6 - 19) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 0.8\text{--}2.0$ d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule/cm}^3$ at room temp. (Atkinson 1991)

$k_{\text{OH}}(\text{calc}) = 4 \times 10^9 \text{ M}^{-1} \text{ s}^{-1}$ in aqueous solutions (Haag & Yao 1992)

$k_{\text{OH}}(\text{calc}) = (2.0 - 5.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 2.8\text{--}7.2 \text{ d}$ for a tetra-chlorinated dioxin at room temp. (relative rate method, Kwok et al. 1995)

Hydrolysis: hydrolysis is not likely under environmental conditions (Callahan et al. 1979; Mabey et al. 1982); no hydrolyzable groups (Howard et al. 1991).

Biodegradation:

$t_{1/2}(\text{aq. aerobic}) = 10032 \text{ h}$, based on soil die-away test data (Kearney et al. 1971; quoted, Howard et al. 1991) and $t_{1/2} = 14160 \text{ h}$, based on lake water and sediment dieaway test data (Ward & Matsumura 1978; quoted, Howard et al. 1991)

$t_{1/2} > 1.0 \text{ yr}$ (Callahan et al. 1979);

$t_{1/2}(\text{aq. anaerobic}) = 40128\text{--}56640 \text{ h}$, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation: $k = 1 \times 10^{-10} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacterial transformation in water (estimated, Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 4.64 \text{ mL g}^{-1} \text{ h}^{-1}$; $k_2 = 5.00 \times 10^{-4} \text{ h}^{-1}$ (rainbow trout, Neely 1979)

$k_1 = 108 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.012 \text{ d}^{-1}$ (rainbow trout, Branson et al. 1983, 1985)

$k_1 = 476 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.120 \text{ d}^{-1}$ (fathead minnow, Adams et al. 1986)

$k_1 = 600 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.046 \text{ d}^{-1}$ (guppy, Opperhuizen et al. 1986)

$k_1 = 1832, 1543, 1337, 1591 \text{ d}^{-1}$ and $k_2 = 0.047, 0.041, 0.015, 0.043 \text{ d}^{-1}$ (rainbow trout, exposed to 38 pg/L, 176 pg/L, 382 pg/L, 702 pg/L for 28 d, Mehrle et al. 1988)

$k_1 = 216, 604 \text{ L kg}^{-1} \text{ d}^{-1}$ (goldfish after 8 h exposure: metabolic inhibitor PBO-treated, control, Sijm et al. 1989)

$k_2 = 0.008 \text{ d}^{-1}$ (rainbow trout, quoted, Opperhuizen & Sijm 1990)

$k_1 = 381 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.048 \text{ d}^{-1}$ (fathead minnow, quoted, Opperhuizen & Sijm 1990)

$k_1 = 100 \text{ mL g}^{-1} \text{ d}^{-1}$ (mosquito fish, quoted, Opperhuizen & Sijm 1990)

$k_1 = 86 \text{ L kg}^{-1} \text{ d}^{-1}$ (goldfish, 120-h exposure, metabolic inhibitor PBO-treated; Sijm et al. 1993)

$k_1 = 66 \text{ L kg}^{-1} \text{ d}^{-1}, 104 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for TCDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_2 > 1.3 \text{ d}^{-1}; < 0.1 \text{ d}^{-1}$ (goldfish after 120-h exposure: metabolic inhibitor PBO-treated; control, Sijm et al. 1993)

$k_1 = 500 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.049 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

$k_2 = 0.0061 \text{ d}^{-1}$ with a biological $t_{1/2} = 49 \text{ d}$ (blue mussel, 99-d exposure, Hektoen et al. 1994)

$k_2 = 0.0246 \text{ d}^{-1}$ with $t_{1/2} = 28 \text{ d}$ (newly contaminated oysters, Gardinali et al. 2004)

$k_2 = 0.0199 \text{ d}^{-1}$ with $t_{1/2} = 35 \text{ d}$ (chronically contaminated oysters, Gardinali et al. 2004)

Half-Lives in the Environment:

Air: dominant transformation process in the atmosphere (Atkinson et al. 1982)

$t_{1/2} = 200 \text{ h}$ for reaction with OH radical (Podoll et al. 1986)

atmospheric lifetime of $\sim 3 \text{ d}$ at room temp. (Atkinson 1987a)

$t_{1/2} = 22.3\text{--}223 \text{ h}$, based on estimated photooxidation half-life in air (Howard et al. 1991)

$t_{1/2} = 1 \text{ h}$, an upper limit, undergo rapid photolysis in vapor phase (Travis & Hattemer-Frey 1987)

atmospheric $k = 0.012 \text{ min}^{-1}$ with $t_{1/2} = 58 \text{ min}$ in summer sunlight at 40°N latitude (Buser 1988)

reaction rate constant $k \sim 0.02 \text{ h}^{-1}$ (Paterson et al. 1990)

tropospheric lifetime $\tau(\text{calc}) = 0.8\text{--}2.0 \text{ d}$ for reaction with OH radical (Atkinson 1991)

tropospheric lifetime $\tau(\text{calc}) = 2.8\text{--}7.2 \text{ d}$ for with OH radical (Kwok et al. 1995);

$t_{1/2} = 200 \text{ h}$ at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000).

Surface water: photolysis $t_{1/2} = 3 \text{ h}$ in methanol solution under sunlight (Plimmer et al. 1973);

$t_{1/2} = 600 \text{ d}$ in a model aquatic environment (Ward & Matsumura 1978);

reaction rate constant estimated to be $2.6 \times 10^{-5} \text{ h}^{-1}$ (Mackay et al. 1985);

calculated sunlight photolysis half-lives over four seasons at 40°N latitude averaged over for 24 h exposure per day: $t_{1/2} = 130 \text{ h}$ in winter, $t_{1/2} = 28 \text{ h}$ in spring, $t_{1/2} = 20 \text{ h}$ in summer and $t_{1/2} = 52 \text{ h}$ in fall (Mill et al. 1982; quoted, Mill 1985);

calculated photolysis half-lives in sunlight at 40°N latitude: $t_{1/2} = 118 \text{ h}$ in winter, $t_{1/2} = 27 \text{ h}$ in spring, $t_{1/2} = 21 \text{ h}$ in summer and $t_{1/2} = 51 \text{ h}$ in fall (Podoll et al. 1986);

photolysis $t_{1/2} = 40 \text{ h}$ in near-surface waters is an important degradative pathway (Travis & Hattemer-Frey 1987);

$t_{1/2} = 14 \text{ min}$, sunlight-induced photolysis half-life in isooctane (Buser 1988);

reaction rate constant estimated to be 0.008 h^{-1} (Paterson et al. 1990);

- photolysis $t_{1/2} = 27\text{--}81$ h, aerobic $t_{1/2} = 1.15\text{--}1.62$ yr, anaerobe $t_{1/2} = 4.58\text{--}6.45$ yr (Howard et al. 1991)
 $t_{1/2} = 4000$ h at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000).
- Groundwater: $t_{1/2} = 20064\text{--}28320$ h, based on estimated unacclimated aerobic biodegradation half-life (Howard et al. 1991).
- Sediment: $t_{1/2} = 12000\text{--}14400$ h in aquatic sediment (Ward & Matsumura 1978; quoted, Quensen & Matsumura 1983)
 reaction rate constant $k \sim 8.0 \times 10^{-6} \text{ h}^{-1}$ (Mackay et al. 1985)
 $k \sim 1.5 \times 10^{-5} \text{ h}^{-1}$ (Paterson et al. 1990)
 $t_{1/2} > 1$ yr (O'Keefe et al. 1986)
 $t_{1/2} = 9.9\text{--}98$ yr (Geyer et al. 2000)
 degradation $t_{1/2} = 20\text{--}200$ yr in sediment for all homologues (estimated, Suzuki et al. 2000)
 $t_{1/2} = 900000$ h at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000).
- Soil: $t_{1/2} = 10032\text{--}14160$ h, based on soil dieaway test data for two soils (Howard et al. 1991);
 $t_{1/2} \sim 1$ yr (Kearney et al. 1973; quoted, Quensen & Matsumura 1983);
 degradation $t_{1/2} = 10\text{--}12$ yr in soil (De Dimenico et al. 1980, Kimbrough et al. 1984);
 $t_{1/2} \sim 1$ yr if applied to surface on soil with 2,4-D (Nash & Beall 1980);
 $k \sim 8.0 \times 10^{-6} \text{ h}^{-1}$ (Mackay et al. 1985)
 $k \sim 1.1 \times 10^{-5} \text{ h}^{-1}$ (Paterson et al. 1990)
 $t_{1/2} = 10$ min during the day, photodegradation is a rapid process at the soil surface (Facchetti et al. 1986);
 $t_{1/2} \sim 10$ yr in soil if TCDD is on or near the surface and $t_{1/2} = 100$ yr if TCDD is buried at greater depth (Nauman & Schaum 1987)
 calculated $t_{1/2} = 10$ yr (Edujee 1987)
 $t_{1/2} = 10$ yr or longer (Boddington et al. 1990)
 $t_{1/2} = 365$ d for volatilization to atmosphere below surface soil (Jury et al. 1990)
 $t_{1/2} = 10$ yr (Geyer et al. 2000)
 degradation $t_{1/2} = 10\text{--}100$ yr in soils (estimated, Suzuki et al. 2000)
 $t_{1/2} = 900000$ h at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000)
- Biota: $t_{1/2} = 31$ d, estimated half-life in rat (Rose et al. 1976; quoted, Birnbaum 1985);
 $t_{1/2} = 11$ d, estimated half-life in hamster (Olsen et al. 1980; quoted, Birnbaum 1985)
 $t_{1/2} = 30$ d, estimated half-life in guinea pig (Decad et al. 1981a; quoted, Birnbaum 1985)
 $t_{1/2} = 11\text{--}24$ d, estimated half-life in mouse (Gasiewicz et al. 1983; quoted, Birnbaum 1985)
 depuration $t_{1/2} = 58$ d, total body burden of ^{14}C -TCDD in whole rainbow trout (Branson et al. 1983, 1985)
 $t_{1/2} = 17\text{--}37$ d in mouse, $t_{1/2} = 31$ d in rat and $t_{1/2} = 30$ d in guinea pig (quoted, Van den Berg et al. 1985)
 elimination $t_{1/2} = 14.5$ d from fathead minnow (Adams et al. 1986)
 $t_{1/2} = 105$ d in whole body of rainbow trout (Kleeman et al. 1986);
 $t_{1/2} = 300\text{--}325$ d in carp (Kuehl et al. 1986)
 biological $t_{1/2} = 58$ d for rainbow trout (Niimi & Oliver 1986)
 $t_{1/2} = 5.8$ yr in human (estimated, Poiger & Schlatter 1986)
 $t_{1/2} > 336$ d for carps in Lake Superior (Kuehl et al. 1987)
 $t_{1/2} = 6.7$ yr in human (estimated, Kissel & Robarge 1988)
 elimination $t_{1/2} = 15\text{--}48$ d from rainbow trout for exposures of different concn (Mehrle et al. 1988)
 $t_{1/2} = 7.1$ yr in human (estimated, Pirkle et al. 1989; quoted, Webster & Connett 1991)
 $t_{1/2} = 5\text{--}8$ yr for human, $t_{1/2} = 17.4\text{--}31$ d for rats, $t_{1/2} = 9.6\text{--}24.4$ d for mice, $t_{1/2} = 22\text{--}93.7$ d for guinea pigs,
 $t_{1/2} = 12.0\text{--}150$ d for hamsters, $t_{1/2} = 1$ yr for monkeys (Boddington et al. 1990)
 $t_{1/2} = 40.3$ d for lactating cows (Olling et al. 1991)
 $t_{1/2} = 5\text{--}10$ yr assumed half-life for human (Schecter & Ryan 1991)
 elimination $t_{1/2} = 35\text{--}37$ d from lake trout sac fry (Walker et al. 1991)
 $t_{1/2} = 4.4$ yr for a 70 kg non-lactating "reference" human (Webster & Connett 1991)
 $t_{1/2} < 0.5$ d for metabolic inhibitor PBO treated gold fish and $t_{1/2} > 7$ d for control fish in 120-h exposure studies (Sijm et al. 1993)
 elimination $t_{1/2} = 45$ d from soft-shell clam (Brown et al. 1994)
 biological $t_{1/2} = 49$ d in blue mussel for 99-d exposure experiment (Hektoen et al. 1994)
 reported $t_{1/2} = 8\text{--}24.4$ d for mice, $t_{1/2} = 30.2$ and 93.7 d for guinea pigs, $t_{1/2} = 20\text{--}28.9$ d for rats and $t_{1/2} = 365\text{--}3470$ d for humans (Miniero et al. 2001).
 depuration $t_{1/2} = 28$ d for newly contaminated oysters, and $t_{1/2} = 35$ d for chronically contaminated oysters (Gardinali et al. 2004)

TABLE 8.1.1.16.1
Reported vapor pressures of 2,3,7,8-tetrachlorodibenzo-*p*-dioxin at various temperatures

$\log P = A - B/(T/K)$		(1)	$\ln P = A - B/(T/K)$		(1a)

8.1.1.17 1,2,3,4,7-Pentachlorodibenzo-*p*-dioxin

Common Name: 1,2,3,4,7-Pentachlorodibenzo-*p*-dioxin

Synonym: 1,2,3,4,7-P₅CDD

Chemical Name: 1,2,3,4,7-pentachlorodibenzo-*p*-dioxin

CAS Registry No: 39227-61-7

Molecular Formula: ClC₆H₃O₂C₆Cl₄

Molecular Weight: 356.416

Melting Point (°C):

195 (Lide 2003)

Boiling Point (°C):

464.7 (calculated, Rordorf 1987, 1989)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

197.74 (calculated-liquid density, Govers et al. 1990)

281.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

92.8 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

137.419 (Rordorf 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

42.4 (Rordorf 1987; quoted, Ruelle & Kesselring 1997)

26 (Friesen & Webster 1990)

Entropy of Fusion, ΔS_{fus} (J/mol K):

90 (Rordorf 1987, 1989)

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 0.0215 (mp at 195°C)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated *, are compiled at the end of this section):

0.000118*; 0.0000855 (20°C, ¹⁴C-labelled, generator column-HPLC/LSC, measured range 20–40°C, calculated, Friesen et al. 1985)

0.0000955 (20°C, ¹⁴C-labeled, generator column-HPLC/LSC, Webster et al. 1986)

1.23 × 10⁻⁴* (21°C, generator column-HPLC/LSC, measured range 7–41°C, Friesen & Webster 1990)

0.00428 (supercooled liquid P_L, GC-RI correlation, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

8.80 × 10⁻⁸* (predicted-vapor pressure correlation method, Rordorf 1985a,b, 1987, 1989)

1.00 × 10⁻⁶ (gas saturation, estimated from vapor pressure vs. temperature plot, Rordorf et al. 1986)

1.00 × 10⁻⁶ (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)

log (P/Pa) = 17.02207 – 7179.05/(T/K); temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)

4.57 × 10⁻⁶ (supercooled liquid P_L, GC-RI correlation; Wang & Wong 2002)

Henry's Law Constant (Pa m³/mol at 25°C):

0.264 (calculated-P/C, Shiu et al. 1988; quoted, Kaupp & McLachlan 1999)

0.224; 1.23 (supercooled liquid P_L, quoted exptl., calculated-SOFA model, Govers & Krop 1998)

0.691; 1.23 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, log K_{ow} :

- 9.44, 9.62, 10.02; 9.39, 9.65, 10.05 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)
 9.40, 9.65 (HPLC-RT correlation, Sarna et al. 1984)
 9.48, 8.80; 9.40, 8.64 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)
 9.65, 7.44 (HPLC-RT correlation, Burkhard & Kuehl 1986)
 6.60 (shake flask/slow stirring-GC/MS, from mixture of fly-ash extract, Sijm et al. 1989)
 7.53 (GC-RI correlation, Wang & Wong 2002)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

- 10.67*; 10.32 (generator column-GC; calculated, Harner et al. 2000)
 log K_{OA} = $-7.65 + 5460/(T/K)$, temp range 30–50°C (Harner et al. 2000)
 10.42 (GC-retention time correlation, Chen et al. 2002)

Bioconcentration Factor, log BCF:

- 3.26 (fathead minnow, steady-state, wet weight, Muir et al. 1985)
 2.50 (rainbow trout, steady-state, wet weight, Muir et al. 1985)
 3.16, 2.91 (fathead minnow, rainbow trout, De Voogt et al. 1990;)
 3.50, 4.50 (fathead minnow, wet wt. based, lipid based, quoted, Gobas & Schrap 1990)
 5.37 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, log K_{OC} at 25°C or as indicated:

- 4.85, 4.60, 4.50 (20, 30, 40°C, fulvic acid from a Manitoba soil, Webster et al. 1986b)
 5.80, 5.67, 5.90 (20, 30, 40°C, humic acid from Manitoba peat bog, Webster et al. 1986b)
 6.38, 6.39, 6.46 (20, 30, 40°C, Aldrich humic acid, Na salt, Webster et al. 1986b)
 5.02 (DOC, De Voogt et al. 1990)
 8.57 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k, or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: rate constant $k = 4.31 \times 10^{-6} \text{ s}^{-1}$ in water-acetonitrile (2:3, v/v) at 313 nm and calculated half-lives under conditions of variable sunlight intensity at 40°N latitude: $t_{1/2} = 18.29 \text{ d}$ in spring with rate constant $k = 0.466 \times 10^{-6} \text{ s}^{-1}$, $t_{1/2} = 15.16 \text{ d}$ in summer with $k = 0.562 \times 10^{-6} \text{ s}^{-1}$, $t_{1/2} = 28.59 \text{ d}$ in fall with $k = 0.298 \times 10^{-6} \text{ s}^{-1}$, $t_{1/2} = 52.37 \text{ d}$ in winter with $k = 0.163 \times 10^{-6} \text{ s}^{-1}$, and $t_{1/2} = 76.82 \text{ d}$ averaged over full year with rate constant $k = 0.111 \times 10^{-6} \text{ s}^{-1}$ (Choudhary & Webster 1985a, 1986);

$k = 4.3115 \times 10^{-6} \text{ s}^{-1}$ in water-acetonitrile (3:3 v/v) at 313 nm (Choudhary & Webster 1985b);

photolysis $k = 4.31 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 45.86 \text{ h}$ in water-acetonitrile (2:3, v/v) at 313 nm and the calculated midday, mid-season direct sunlight photolysis first-order rate constant in aquatic bodies for various seasons: $k = 4.03 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 18 \text{ d}$ in spring, $k = 4.86 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 15 \text{ d}$ in summer, $k = 2.58 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 29 \text{ d}$ in fall, $k = 1.41 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 52 \text{ d}$ in winter (Choudhary & Webster 1989);

$k = 0.74 \text{ d}^{-1}$ under mid-summer sunlight at 50°N latitude in filtered-sterilized natural water and $k = 0.058 \text{ d}^{-1}$ in (2:3, v/v) distilled water-acetonitrile (Friesen et al. 1990);

photolytic $t_{1/2} = 38 \text{ h}$ in fly-ash extract (Tysklind & Rappe 1991);

$t_{1/2} = 92 \text{ h}$ for photodegradation in a rotary photoreactor adsorbed to clean silica gel by filtered <290 nm of light (Koester & Hites 1992).

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (12 - 14) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (6.5 - 14) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 1.1\text{--}2.4 \text{ d}$ based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ at room temp. (Atkinson 1991)

$k_{OH}(\text{calc}) = (1.7 - 3.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 4.0\text{--}8.5 \text{ d}$ for a penta-chlorinated dioxin at room temp. (relative rate method, Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation: biotransformation rate constant $k = 0.014 \text{ d}^{-1}$ for rainbow trout (Sijm et al. 1990).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 285 \text{ d}^{-1}$; $k_2 = 0.22 \text{ d}^{-1}$ (fathead minnow, flow-through system, Muir et al. 1985)

$k_1 = 204 \text{ d}^{-1}$; $k_2 = 0.28 \text{ d}^{-1}$ (rainbow trout, flow-through system, Muir et al. 1985)

$k_2 = 2.5 \times 10^{-2}$, $3.9 \times 10^{-2} \text{ d}^{-1}$ (rainbow trout for 2 to 21 d exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1990)

$k_1 = 509$, $162 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 < 0.1$, $> 1.5 \text{ d}^{-1}$ (goldfish after 120-h exposure for metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_1 = 169 \text{ L kg}^{-1} \text{ d}^{-1}$, $251 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for P₅CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: tropospheric lifetime of 1.1–2.4 d calculated for the gas-phase with OH radicals using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$, (Atkinson 1991);

photodegradation $t_{1/2} = 92 \text{ h}$ in a rotary photo-reactor adsorbed to clean silica gel by filtered $\lambda < 290 \text{ nm}$ of light (Koester & Hites 1992);

calculated tropospheric lifetime of 4.0–8.5 d for penta-chlorinated dioxin for the gas-phase reaction with OH radical at room temp. (Kwok et al. 1995);

suggested $t_{1/2} = 200 \text{ h}$ at 7°C for Baltic Proper environment (Sinkkonen & Passivirta 2000).

Surface water: under conditions of variable sunlight intensity at 40°N latitude in aqueous acetonitrile solution (4:6, v/v): $t_{1/2} = 18.29 \text{ d}$ in spring, $t_{1/2} = 15.16 \text{ d}$ in summer, $t_{1/2} = 28.6 \text{ d}$ in fall, $t_{1/2} = 52.37 \text{ d}$ in winter, and $t_{1/2} = 76.82 \text{ d}$ averaged over full year (Choudhary & Webster 1985a, 1986);

photolysis $t_{1/2} = 45.86 \text{ h}$ in water-acetonitrile (2:3, v/v) at 313 nm and the calculated midday, midseason direct phototransformation half-lives near water bodies at 40°N latitude: $t_{1/2} = 18.4 \text{ d}$ in spring, $t_{1/2} = 15 \text{ d}$ in summer, $t_{1/2} = 29 \text{ d}$ in fall and $t_{1/2} = 52 \text{ d}$ in winter (Choudhary & Webster 1989);

$t_{1/2} = 27 \text{ d}$ in sunlit surface water and $t_{1/2} = 0.94 \text{ d}$ in surface water of actual pond (Friesen et al. 1990).

Groundwater:

Sediment: degradation half-lives in sediment 20–200 yr for all homologues (estimated, Suzuki et al. 2000).

Soil: degradation half-lives in soil 10–100 yr (estimated, Suzuki et al. 2000).

Biota: $t_{1/2} = 3.1 \text{ d}$ in fathead minnow (Adams et al. 1986);

$t_{1/2} = 2 \text{ d}$ in whole body of rainbow trout (Muir & Yarechewski 1988);

half-lives in gold fish: $t_{1/2} > 7 \text{ d}$ for PBO treated and $t_{1/2} < 0.5 \text{ d}$ for control fish in 120-h exposure studies (Sijm et al. 1993).

1.71×10^{-4} ; 1.23×10^{-7} (supercooled liquid P_L; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/\text{Pa}) = 12.72 - 5850/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/\text{Pa}) = 8.38 - 3321/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

4.17×10^{-6} ; 1.20×10^{-5} (supercooled liquid P_L; GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Henry's Law Constant (Pa m³/mol at 25°C and the reported temperature dependence equations):

1.48 (calculated-SOFA model, Govers & Krop 1998)

$\log (H/(\text{Pa m}^3/\text{mol})) = 7.94 - 1089/(T/K)$ (Passivirta et al. 1999)

0.661; 1.48 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, log K_{ow}:

6.64 (shake flask/slow stirring-GC/MS, from mixture of fly-ash extract, Sijm et al. 1989a)

7.50 (calculated-SOFA model, Govers & Krop 1998)

7.27 (estimated-solubility S_L and regression eq. using lit. K_{ow} values, Passivirta et al. 1999)

- 7.215 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
 7.55; 7.50 (GC-RI correlation; calculated-SOFA, Wang & Wong 2002)
 6.78, 6.84, 6.49, 6.87 (calculated-QSPR: PLS, BPN GRNN, MOD models, Zheng et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section:

- 10.57*; 10.44 (generator column-GC; calculated, Harner et al. 2000)
 11.63 (7°C, GC-retention time correlation, Harner et al. 2000)
 $\log K_{OA} = -8.02 + 5540/(T/K)$; temp range 30–50°C (generator column-GC/ECD, Harner et al. 2000)
 10.46 (GC-retention time indices correlation, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 3.20 (guppy, exposed to fly ash extract, Opperhuizen et al. 1986)
 3.93; 4.31 (goldfish: PBO treated; control, 120-h exposure, Sijm et al. 1993)
 5.27 (guppies, 21-d exposure, system-I absence of sediment, Loonen et al. 1994b)
 4.98 (guppies, 21-d exposure, system-II with sediment, Loonen et al. 1984b)
 5.34 (calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.91 (calculated-QSAR, Fiedler & Schramm 1990)
 6.80 (Baltic sea particulate field samples, concentration distribution-GC/MS, Broman et al. 1991)
 8.72 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: solution photolysis $t_{1/2} = 456$ min in *n*-hexadecane at 1.0 m from a GE Model RS sunlamp and surface photolysis $t_{1/2} = 52.8$ min on a clean glass surface under the same conditions (Nestrick et al. 1980; quoted, Mamantov 1984);

photolytic degradation in extract from fly ash exposed to UV light from a distance of 20 cm with $t_{1/2} = 33.6$ h for native congener and $t_{1/2} = 16.7$ h for ^{13}C -labeled congener in tetradecane solution (Tysklind & Rappe 1991);

$t_{1/2} = 57.8$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 6.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (6.5 - 14) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 1.1\text{--}2.4$ d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ at room temp. (Atkinson 1991)

$k_{OH}(\text{calc}) = (1.7 - 3.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 4.0\text{--}8.5$ d for a penta-chlorinated dioxin at room temp. (relative rate method, Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 700 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.090 \text{ d}^{-1}$ (guppy, Opperhuizen et al. 1986)

$k_1 = 127, 695 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.02, < 0.1 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated, control goldfish, 120-h exposure, Sijm et al. 1993)

$k_1 = 169 \text{ L kg}^{-1} \text{ d}^{-1}$, $251 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for P_3CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_1 = 952 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.030 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

$k_2 = 0.0051 \text{ d}^{-1}$ with $t_{1/2} = 50$ d (blue mussel, 99-d exposure, Hektoen et al. 1994)

Half-Lives in the Environment:

Air: for a penta-chlorinated dioxin, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$, the tropospheric lifetime $\tau = 1.1\text{--}2.4$ d for the gas phase with OH radical (Atkinson 1991);

calculated tropospheric lifetime $\tau = 4.0\text{--}8.5$ d for reaction with OH radical (Kwok et al. 1995);

$t_{1/2} = 360$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: $t_{1/2} = 7200$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Groundwater:

Sediment: $t_{1/2} = 1000000$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

degradation $t_{1/2} = 20\text{--}200$ yr in sediment for all homologues (estimated, Suzuki et al. 2000).

Soil: $t_{1/2} = 1,000,000$ h at 7°C for Baltic Proper environment (Sinkkonen & Passivirta 2000);

degradation $t_{1/2} = 10\text{--}100$ yr in soil (estimated, Suzuki et al. 2000).

Biota: half-lives in gold fish: $t_{1/2} = 32$ d for PBO treated and $t_{1/2} > 7$ d for control fish in 120-h exposure studies (Sijm et al. 1993);

$t_{1/2} = 49$ d in blue mussel for 99-d exposure experiment (Hektoen et al. 1994).

TABLE 8.1.1.18.1

Reported vapor pressures and octanol-air partition coefficients of 1,2,3,7,8-pentachlorodibenzo-*p*-dioxin at various temperatures

Vapor pressure		log K_{OA}	
Rordorf 1987, 1989		Harner et al. 2000	
vapor pressure correlation		generator column-GC/ECD	
$t/^\circ\text{C}$	P/Pa	$t/^\circ\text{C}$	log K_{OA}
25	5.8×10^{-8}	20	10.867
50	3.8×10^{-6}	40	9.755
75	1.4×10^{-4}	50	9.083
100	3.0×10^{-3}	25	10.57
125	4.6×10^{-2}		
$\Delta H_v/(\text{kJ mol}^{-1}) = 88.7$		$\log K_{OA} = a + b/(T/K)$	
$\Delta H_{\text{sub}}/(\text{kJ mol}^{-1}) = 138.062$		a	-8.02
$\Delta H_{\text{fus}}/(\text{kJ mol}^{-1}) = 42.4$		b	5540
		$\Delta H_{OA}/(\text{kJ mol}^{-1}) = 106$	
		for GC-RT correlation	

FIGURE 8.1.1.18.1 Logarithm of vapor pressure and K_{OA} versus reciprocal temperature for 1,2,3,7,8-pentachlorodibenzo-*p*-dioxin.

8.1.1.19 1,2,4,7,8-Pentachlorodibenzo-*p*-dioxin

Common Name: 1,2,4,7,8-Pentachlorodibenzo-*p*-dioxin

Synonym: 1,2,4,7,8-P₅CDD

Chemical Name: 1,2,4,7,8-pentachlorodibenzo-*p*-dioxin

CAS Registry No: 58802-08-7

Molecular Formula: Cl₅C₆H₂O₂C₆HCl₃

Molecular Weight: 356.416

Melting Point (°C):

206 (Rordorf 1987)

Boiling Point (°C):

464.7 (calculated, Rordorf 1987, 1989)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

199.91 (calculated-liquid density, Govers et al. 1990)

281.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

91.8 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

136.636 (Rordorf 1987)

125.3 (Li et al. 2004)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

42.4 (Rordorf 1987)

Entropy of Fusion, ΔS_{fus} (J/mol K):

88 (Rordorf 1987, 1989)

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F: 0.0168 (mp at 206°C)

Water Solubility (g/m³ or mg/L at 25°C):

9.82×10^{-5} (calculated-QSAR, Fielder & Schramm 1990)

4.92×10^{-3} (supercooled liquid S_L, quoted exptl., calculated-SOFA model, Govers & Krop 1998)

5.39×10^{-3} ; 4.92×10^{-3} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and the reported temperature dependence equations):

7.80×10^{-8} , 5.6×10^{-6} , 2.1×10^{-4} , 5.1×10^{-3} , 8.0×10^{-2} (25, 50, 75, 100, 125°C, predicted-vapor pressure correlation method, Rordorf 1985a,b, 1987, 1989)

1.58×10^{-5} (supercooled liquid P_L, calculated-SOFA model, Govers & Krop 1998)

6.026×10^{-6} ; 1.58×10^{-5} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

$\ln(P/\text{Pa}) = 38.743 - 16431/(T/\text{K})$; temp range 298–398 K (regression eq. of Rordorf 1989 data, Li et al. 2004)

$\ln(P/\text{Pa}) = (36.472 \pm 0.679) - (15073 \pm 282)/(T/\text{K})$; temp range 403–428 K (Knudsen effusion technique, Li et al. 2004)

Henry's Law Constant (Pa m³/mol):

1.096 (calculated-SOFA model, Govers & Krop 1998)

7.41; 1.096 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, log K_{ow}:

6.64 (shake flask/slow stirring-GC/MS, from mixture of fly-ash extract, Sijm et al. 1989)

8.41 (calculated-QSAR, Fiedler & Schramm 1990)

7.36 (calculated-SOFA model, Govers & Krop 1998)

7.46; 7.36 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

6.20; 6.71, 6.78, 6.55, 6.87 (observed; calculated-QSPR: PLS, BPN GRNN, MOD models, Zheng et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

5.34 (calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

5.91 (calculated-QSAR, Fiedler & Schramm 1990)

8.72 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Volatilization:

Photolysis: $t_{1/2} = 81.5$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 6.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (6.5 - 14) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime of 1.1 – 2.4 d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ at room temp. (Atkinson 1991)

$k_{OH}(\text{calc}) = (1.7 - 3.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime of 4.0–8.5 d for a penta-chlorinated dioxin at room temp. (relative rate method, Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 61, 164 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.21, > 1.9 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated, control goldfish, 120-h exposure, Sijm et al. 1993)

$k_1 = 169 \text{ L kg}^{-1} \text{ d}^{-1}$, $251 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $P_5\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: tropospheric lifetime $\tau = 1.1\text{--}2.4$ d calculated for a penta-chlorinated dioxin based on the gas-phase reaction with OH radicals (Atkinson 1991); calculated tropospheric lifetime $\tau = 2.8\text{--}7.2$ d for the gas-phase reaction with OH radical (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200$ yr in sediment for all homologues (estimated, Suzuki et al. 2000).

Soil: degradation $t_{1/2} = 10\text{--}100$ yr in soil (estimated, Suzuki et al. 2000).

Biota: half-lives in gold fish: $t_{1/2} = 3.3$ d for PBO treated and $t_{1/2} > 1.9$ d for control fish in 120-h exposure studies (Sijm et al. 1993).

8.1.1.20 1,2,3,4,7,8-Hexachlorodibenzo-*p*-dioxin

Common Name: 1,2,3,4,7,8-Hexachlorodibenzo-*p*-dioxin

Synonym: 1,2,3,4,7,8-H₆CDD

Chemical Name: 1,2,3,4,7,8-hexachlorodibenzo-*p*-dioxin

CAS Registry No: 39227-26-8

Molecular Formula: Cl₂C₆H₂O₂C₆Cl₄

Molecular Weight: 390.861

Melting Point (°C):

273–275 (Pohland & Yang 1972; Rordorf 1987,1989; Delle Site 1997)

Boiling Point (°C):

487.7 (calculated, Rordorf 1987,1989)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

206.96 (calculated-liquid density, Govers et al. 1990)

302.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

89.1 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

140.782 (Rordorf 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

48.1 (Rordorf 1987; quoted, Ruelle & Kesselring 1997)

30.21 (Friesen & Webster 1990)

Entropy of Fusion, ΔS_{fus} (J/mol K):

88 (Rordorf 1987, 1989; quoted, Passivirta et al. 1999)

Fugacity Ratio at 25°C, F: 0.00369 (assuming ΔS_{fus} = 56 J/mol K and mp at 273°C)

0.00352 (calculated-assuming ΔS_{fus} = 56 J/mol K, Shiu et al. 1988)

0.000148 (calculated-ΔS_{fus} and mp, Passivirta et al. 1999)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

4.40 × 10⁻⁶* (20°C, ¹⁴C-labeled, generator column-HPLC/LSC, measured range 20–40°C, Friesen et al. 1985)

5.70 × 10⁻⁶ (20°C, ¹⁴C-labeled, generator column-HPLC/LSC, Webster et al. 1986b)

4.89 × 10⁻⁶* (21°C, generator column-HPLC/LSC, measured range 7–41°C, Friesen & Webster 1990)

log [S_L/(mol/L)] = 0.235 B 2515/(T/K) (supercooled liquid, Passivirta et al. 1999)

1.15 × 10⁻³ (supercooled liquid S_L; GC-RI correlation, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated *, are compiled at the end of this section):

5.10 × 10⁻⁹* (calculated-vapor pressure correlation method, Rordorf 1985a,b, 1987, 1989)

3.20 × 10⁻⁷ (gas saturation, estimated from vapor pressure vs. temperature plot, Rordorf et al. 1986)

3.96 × 10⁻⁶ (supercooled liquid P_L, GC-RT correlation, Eitzer & Hites 1988, 1991)

5.43 × 10⁻⁶ (supercooled liquid P_L, GC-RT correlation, Eitzer & Hites 1989)

1.00 × 10⁻⁸ (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)

1.45 × 10⁻⁶ (supercooled liquid P_L, GC-RT correlation, Falconer & Bidleman 1994)

1.36 × 10⁻⁹, 1.87 × 10⁻⁹ (solid P_S, calculated from reported P_L, Delle Site 1997)

3.19 × 10⁻⁶ (corrected supercooled liquid P_L, Eitzer & Hites 1998)

5.20 × 10⁻⁵; 7.70 × 10⁻⁹ (supercooled liquid P_L; converted to solid P_S with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/\text{Pa}) = 12.97 - 6282/(T/\text{K})$ (solid, Passivirta et al. 1999)
 $\log (P_L/\text{Pa}) = 8.37 - 3769/(T/\text{K})$ (supercooled liquid, Passivirta et al. 1999)
 $\log (P/\text{Pa}) = 15.65106 - 7087.08/(T/\text{K})$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)
 3.72×10^{-5} (supercooled liquid P_L , Harner et al. 2000)
 8.91×10^{-7} (supercooled liquid P_L ; GC-RI correlation; Wang & Wong 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

0.452 (calculated-P/C, Shiu et al. 1988; quoted, Kaupp & McLachlan 1999)
 0.631; 1.45 (quoted lit., calculated-SOFA model, Govers & Krop 1998)
 $\log (H/(\text{Pa m}^3/\text{mol})) = 8.14 - 1254/(T/\text{K})$ (Passivirta et al. 1999)
 0.427; 1.45 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

10.36, 10.39, 10.89; 10.22, 10.44, 10.89 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)
 10.40, 9.65; 10.22, 9.19 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)
 10.44, 7.79 (HPLC-RT correlation, Burkhard & Kuehl 1986)
 7.80 (selected, Shiu et al. 1988)
 8.0 (calculated-QSAR, Fiedler & Schramm 1990)
 7.30 (calculated, Broman et al. 1991)
 9.53 (HPLC-RT correlation, Chessells et al. 1991)
 9.13 (calculated-fragment const., Chessells et al. 1991)
 10.22 (quoted, Hansch et al. 1995)
 7.94 (calculated-SOFA model, Govers & Krop 1998)
 7.90 (estimated-solubility S_L and regression eq. using lit. K_{ow} values, Passivirta et al. 1999)
 7.628 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
 7.94; 7.94 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)
 7.80; 7.12, 7.12, 7.25, 7.30 (observed; calculated-QSPR: PLS, BPN GRNN, MOD models, Zheng et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

11.50 (calculated- K_{ow}/K_{Aw} , Wania & Mackay 1996)
 11.17 (calculated, Finizio et al. 1997)
 11.11*; 10.88 (generator column-GC; calculated, Harner et al. 2000)
 12.20 (7°C, GC-retention time correlation, Harner et al. 2000)
 $\log K_{OA} = -6.20 + 5160/(T/\text{K})$; temp range 30–50°C (generator column-GC/ECD, Harner et al. 2000)
 10.95 (GC-retention time indices correlation, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

3.73, 4.00 (rainbow trout, fathead minnow, steady-state, wet weight, Muir et al. 1985)
 4.00, 5.00 (fathead minnow, wet wt. based, lipid based, quoted, Gobas & Schrap 1990)
 3.41, 3.76 (fathead minnow, quoted, Opperhuizen & Sijm 1990)
 3.45, 3.23 (rainbow trout, quoted, Opperhuizen & Sijm 1990)
 3.45, 4.87 (goldfish: PBO treated, control fish, 120-h exposure, Sijm et al. 1993)
 5.01; 4.65 (guppies, 21-d exposure, lipid wt: system I - absence of sediment; system II - with presence of sediment, Loonen et al. 1994a)
 5.01; 5.01; 5.14 (guppy, 21-d exposure, lipid wt basis: measured- C_{fish}/C_w ; calculated; rate constant ratio k_1/k_2 from non-linear regression analysis, Loonen et al. 1994b)
 5.01; 5.07 (lipid wt base, quoted exptl., calculated-SOFA model, Govers & Krop 1998)
 5.90, 5.98 (fish muscle $\log BCF_L$ calculated from water, calculated from sediment, Wu et al. 2001)

Sorption Partition Coefficient, $\log K_{oc}$ at 25°C or as indicated:

5.41, 5.31, 5.13 (20, 30, 40°C, fulvic acid from a Manitoba soil, Webster et al. 1986)
 6.02, 6.15, 5.95 (20, 30, 40°C, humic acid from Manitoba peat bog, Webster et al. 1986)
 6.32, 6.27, 6.15 (20, 30, 40°C, Aldrich humic acid, Na salt, Webster et al. 1986b)
 5.02 (DOC, De Voogt et al. 1990)
 7.10 (Baltic Sea particulate field samples, concentration distribution-GC/MS, Broman et al. 1991)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

$k(\text{calc}) = 1.06 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 7.57 \text{ d}$ in spring, $k = 1.280 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 6.27 \text{ d}$ in summer, $k = 0.676 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 11.87 \text{ d}$ in autumn, $k = 0.37 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 21.57 \text{ d}$ in winter and the averaged $k = 0.252 \times 10^{-6} \text{ s}^{-1}$ over full year with $t_{1/2} = 31.85 \text{ d}$, under conditions of variable sunlight intensity at 40°N latitude in aqueous acetonitrile (4:6 v/v) solution (Choudhary & Webster 1985a,c, 1986)

$k = 7.86 \times 10^{-6} \text{ s}^{-1}$ in water-acetonitrile (2:3, v/v) under direct sunlight (Choudhary & Webster 1985b)

$k = 7.86 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 24.5 \text{ h}$ in water-acetonitrile (2:3, v/v) at 313 nm and the calculated midday, midseason direct sunlight photolysis first-order rate constant in aquatic bodies for various seasons:

$k = 9.16 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 7.6 \text{ d}$ in spring, $k = 11.06 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 6.3 \text{ d}$ in summer, $k = 5.84 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 12.0 \text{ d}$ in fall, $k = 3.21 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 22.0 \text{ d}$ in winter (Choudhary & Webster 1989)

$k = 0.28 \text{ d}^{-1}$ in natural water and $k = 0.019 \text{ d}^{-1}$ in distilled water-acetonitrile (Friesen et al. 1990)

photolytic $t_{1/2}(\text{calc}) = 38 \text{ h}$ in the fly ash extract in tetradecane (Tysklind & Rappe 1991)

photodegradation $t_{1/2} = 140 \text{ h}$ in a rotary photoreactor absorbed to silica gel by filtered $< 290 \text{ nm}$ of light (Koester & Hites 1992)

$t_{1/2} = 91.8 \text{ h}$ on spruce needles surface under sunlight irradiation (Niu et al. 2003).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

k (oxidative degradation rate constant of water dissolved PCDD is $5.02 \times 10^4 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline condition at pH 10 and 20°C (Palauschek & Scholz 1987)

$k_{\text{OH}}(\text{calc}) = (4.6 - 5.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{\text{OH}} = (4.6 - 10) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 1.5\text{--}3.4 \text{ d}$ based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a hexa-chlorinated dioxin at room temp. (Atkinson 1991)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 102 \text{ d}^{-1}$; $k_2 = 0.046 \text{ d}^{-1}$ (rainbow trout, flow-through system, Muir et al. 1985)

$k_1 = 112 \text{ d}^{-1}$; $k_2 = 0.030 \text{ d}^{-1}$ (fathead minnow, Muir et al. 1985)

$k_2 = 0.030 \text{ d}^{-1}$ (fathead minnow, Muir et al. 1985)

$k_2 = 0.015 \text{ d}^{-1}$ (rainbow trout, Muir & Yarechewski 1988)

$k_2 = 0.0066 \text{ d}^{-1}$ (fathead minnow, Muir & Yarechewski 1988)

$k_1 = 58 \text{ L kg}^{-1} \text{ d}^{-1}$, $299 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for H_6CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_2 = 0.29$, $> 0.02 \text{ d}^{-1}$ (goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control, Sijm et al. 1993)

$k_1 = 868 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.065 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

$k_2 = 0.0105 \text{ d}^{-1}$ with $t_{1/2} = 29 \text{ d}$ (blue mussel, 99-d exposure, Hektoen et al. 1994)

Half-Lives in the Environment:

Air: estimated reaction rate constant, $k = 0.005 \text{ h}^{-1}$ (Paterson et al. 1990);

tropospheric lifetime $\tau = 1.5\text{--}3.4 \text{ d}$ for a hexa-chlorinated dioxin reaction with the OH radicals using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$, (Atkinson 1991);

photodegradation $t_{1/2} = 140 \text{ h}$ in a rotary photoreactor adsorbed to clean silica gel by filtered $\lambda < 290 \text{ nm}$ of light, (Koester & Hites 1992);

suggested $t_{1/2} = 740 \text{ h}$ at 7°C for Baltic Proper environment (Sinkkonen & Passivirta 2000).

Surface water: under conditions of variable sunlight intensity at 40°N latitude: $t_{1/2} = 7.57 \text{ d}$ in spring, $t_{1/2} = 6.27 \text{ d}$ in summer, $t_{1/2} = 11.87 \text{ d}$ in fall, $t_{1/2} = 21.57 \text{ d}$ in winter, and $t_{1/2} = 76.8 \text{ d}$ averaged over full year (Choudhary & Webster 1985a, 1986);

photolysis $t_{1/2} = 24.5 \text{ h}$ in water-acetonitrile (2:3, v/v) at 313 nm and the calculated midday, midseason direct phototransformation half-lives near water bodies at 40°N latitude: 7.6 d in spring, 6.3 d in summer, 12.0 d in fall and 22.0 d in winter (Choudhary & Webster 1989);

$t_{1/2} = 81 \text{ d}$ in sunlit surface water and $t_{1/2} = 2.5 \text{ d}$ in surface water of actual pond (Friesen et al. 1990);

estimated reaction rate constant, $k = 0.002 \text{ h}^{-1}$ (Paterson et al. 1990);

suggested $t_{1/2} = 14800 \text{ h}$ at 7°C for Baltic Proper environments (Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: estimated reaction rate constant $k = 4.0 \times 10^{-6} \text{ h}^{-1}$ (Paterson et al. 1990);

degradation $t_{1/2} = 20\text{--}200 \text{ yr}$ in sediment for all homologues (estimated, Suzuki et al. 2000);

suggested $t_{1/2} = 2400000 \text{ h}$ at 7°C for Baltic Proper environments (Sinkkonen & Passivirta 2000).

Soil: estimated reaction rate constant $k = 2.8 \times 10^{-6} \text{ h}^{-1}$ (Paterson et al. 1990);

degradation $t_{1/2} = 10\text{--}100 \text{ yr}$ in soil for all homologues (estimated, Suzuki et al. 2000);

$t_{1/2} = 2400000 \text{ h}$ at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000).

Biota: $t_{1/2} = 43 \text{ d}$ in whole body of rainbow trout (Muir et al. 1988; quoted, Muir et al. 1990);

half-lives in gold fish: $t_{1/2} = 2.4 \text{ d}$ for PBO treated and $t_{1/2} = 40 \text{ d}$ for control fish in 120-h exposure studies (Sijm et al. 1993);

$t_{1/2} = 29 \text{ d}$ in blue mussel for 99-d exposure experiment (Hektoen et al. 1994).

TABLE 8.1.1.20.1

Reported aqueous solubilities, vapor pressures and octanol-air partition coefficients of 1,2,3,4,7,8-hexachlorodibenzo-*p*-dioxin at various temperatures

Aqueous solubility				Vapor pressure		log K_{OA}	
Friesen et al. 1985		Friesen & Webster 1990		Rordorf 1987, 1989		Harner et al. 2000	
generator column-HPLC/LSC		generator column-HPLC/LSC		vapor pressure correlation		generator column-GC/ECD

		26	7.90×10^{-6}	125	8.0×10^{-3}		
		41	1.90×10^{-5}				
		$\Delta H_{\text{sol}}/(\text{kJ mol}^{-1}) = 45.5$		$\Delta H_{\text{v}}/(\text{kJ mol}^{-1}) = 89.1$		log $K_{OA} = a + b/(T/K)$	
		7–41 $^\circ\text{C}$		$\Delta H_{\text{subl}}/(\text{kJ mol}^{-1}) = 140.78$		a	–6.20
				$\Delta H_{\text{fus}}/(\text{kJ mol}^{-1}) = 48.1$		b	5160
				$\Delta S_{\text{fus}}/(\text{J mol}^{-1} \text{ K}^{-1}) = 88$		enthalpy of phase change	
						$\Delta H_{OA}/(\text{kJ mol}^{-1}) = 98.70$	

FIGURE 8.1.1.20.1 Logarithm of mole fraction solubility, vapor pressure and K_{OA} versus reciprocal temperature for 1,2,3,4,7,8-hexachlorodibenzo-*p*-dioxin.

8.1.1.21 1,2,3,6,7,8-Hexachlorodibenzo-*p*-dioxin

Common Name: 1,2,3,6,7,8-Hexachlorodibenzo-*p*-dioxin

Synonym: 1,2,3,6,7,8-H₆CDD

Chemical Name: 1,2,3,6,7,8-hexachlorodibenzo-*p*-dioxin

CAS Registry No: 57653-85-7

Molecular Formula: Cl₃C₆HO₂C₆HCl₃

Molecular Weight: 390.861

Melting Point (°C):

285 (Lide 2003)

Boiling Point (°C):

487.7 (calculated, Rordorf 1987,1989)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

207.16 (calculated-liquid density, Govers et al. 1990)

302.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

88.1 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

139.975 (Rordorf 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

48.1 (Rordorf 1987)

Entropy of Fusion, ΔS_{fus} (J/mol K):

86 (Rordorf 1987, 1989)

Fugacity Ratio at 25°C, F: 0.00281 (assuming ΔS_{fus} = 56 J/mol K and mp at 185°C)

0.000167 (calculated, Passivirta et al. 1999)

Water Solubility (g/m³ or mg/L at 25°C and the reported temperature dependence equations):

8.75 × 10⁻⁴ (calculated-SOFA model, Govers & Krop 1998)

log [S_L/(mol/L)] = 0.125 – 2515/(T/K) (supercooled liquid, Passivirta et al. 1999)

1.10 × 10⁻³, 8.75 × 10⁻⁴ (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and the reported temperature dependence equations):

4.80 × 10⁻⁹, 3.80 × 10⁻⁷, 1.60 × 10⁻⁵, 4.0 × 10⁻⁴, 6.9 × 10⁻³ (25, 50, 75, 100, 125°C, predicted-vapor pressure correlation method, Rordorf 1985a,b, 1987, 1989)

3.31 × 10⁻⁶ (supercooled liquid P_L, calculated-SOFA model, Govers & Krop 1998)

5.20 × 10⁻⁵; 8.69 × 10⁻⁹ (supercooled liquid P_L; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

log (P_s/Pa) = 12.96 – 6363/(T/K) (solid, Passivirta et al. 1999)

log (P_L/Pa) = 8.47 – 3751/(T/K) (supercooled liquid, Passivirta et al. 1999)

8.51 × 10⁻⁷, 3.31 × 10⁻⁶ (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Henry's Law Constant (Pa m³/mol at 25°C and the reported temperature dependence equations):

1.45 (calculated-SOFA model, Govers & Krop 1998)

log [H/(Pa m³/mol)] = 8.35 – 1236/(T/K) (Passivirta et al. 1999)

0.417; 1.45 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, log K_{ow}:

9.13 (calculated-QSAR, Fiedler & Schramm 1990)

7.80 (calculated, Broman et al. 1991)

- 7.98 (calculated-SOFA model, Govers & Krop 1998)
- 7.96 (estimated-solubility S_L and regression eq. using lit. K_{OW} values, Passivirta et al. 1999)
- 7.639 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
- 7.94; 7.94 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)
- 7.58 (calculated-QSPR: GRNN model General Regression Neural Network, Zheng et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 12.22 (7°C, GC-retention time correlation, Harner et al. 2000)
- 10.97 (GC-retention time indices correlation, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 3.41, 4.61 (goldfish: PBO treated, control fish, 120-h exposure, Sijm et al. 1993)
- 4.94; 4.70 (guppy, 21-d exposure, lipid wt: system I - absence of sediment; system II - with presence of sediment, Loonen et al. 1994a)
- 4.94; 5.05; 5.24 (guppies, 21-d exposure, lipid wt basis: measured- C_{fish}/C_W ; calculated; rate constant ratio k_1/k_2 from non-linear regression analysis, Loonen et al. 1994b)
- 5.98 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)
- 5.56 (fish muscle $\log BCF_L$ calculated from water, Wu et al. 2001)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.69 (organic carbon, calculated-QSAR, Fiedler & Schramm 1990)
- 7.60 (Baltic Sea particulate field samples, concn distribution-GC/MS, Broman et al. 1991)
- 9.42 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

- Photolysis: solution photolysis $t_{1/2} = 379$ min in *n*-hexadecane at 1.0 m from a GE Model RS sunlamp and surface photolysis $t_{1/2} = 44100$ min on a clean glass surface under the same conditions (Nestrick et al. 1980; quoted, Mamantov 1984);
- photolytic degradation in extract from fly ash exposed to UV light from a distance of 20 cm with $t_{1/2} = 17.3$ h for native congener and $t_{1/2} = 14.2$ h for ^{13}C -labeled congener in tetradecane solution (Tysklind & Rappe 1991);
- $t_{1/2} = 76.2$ h on spruce needle surface under sunlight irradiation (Niu et al. 2003).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

- $k_{OH}(\text{calc}) = (4.6 - 5.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)
- $k_{OH} = (4.6 - 10) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 1.5\text{--}3.4$ d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a hexa-chlorinated dioxin at room temp. (Atkinson 1991)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

- $k_1 = 432 \text{ L kg}^{-1} \text{ d}^{-1}$ (goldfish after 120-h exposure, control fish, Sijm et al. 1993)
- $k_1 = 58 \text{ L kg}^{-1} \text{ d}^{-1}$, $299 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for H_6CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)
- $k_2 = 0.23, < 0.1 \text{ d}^{-1}$ (goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)
- $k_1 = 844 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.050 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)
- $k_2 = 0.0075 \text{ d}^{-1}$ with $t_{1/2} = 60$ d (blue mussel, 99-d exposure, Hektoen et al. 1994)

Half-Lives in the Environment:

- Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$, the tropospheric lifetime of a hexa-chlorinated dioxin was calculated to be 1.5–3.4 d for the gas-phase reaction with the OH radical (Atkinson 1991);

$t_{1/2} = 740$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: $t_{1/2} = 14800$ h at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200$ yr in sediment for all homologues (estimated, Suzuki et al. 2000);

$t_{1/2} = 550000$ h at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000).

Soil: degradation $t_{1/2} = 10\text{--}100$ yr in soil for all homologues (estimated, Suzuki et al. 2000);

$t_{1/2} = 550\,000$ h at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000).

Biota: 43 d in whole body of rainbow trout (Muir et al. 1988; quoted, Muir et al. 1990);

$t_{1/2} = 3.0$ d for PBO treated gold fish, $t_{1/2} > 7$ d for control fish in 120-h exposure studies (Sijm et al. 1993);

$t_{1/2} = 40$ d in blue mussel for 99-d exposure experiment (Hektoen et al. 1994).

8.1.1.22 1,2,3,7,8,9-Hexachlorodibenzo-*p*-dioxin

Common Name: 1,2,3,7,8,9-Hexachlorodibenzo-*p*-dioxin

Synonym: 1,2,3,7,8,9-H₆CDD OR 2,3,4,6,7,8-H₆CDD

Chemical Name: 1,2,3,7,8,9-hexachlorodibenzo-*p*-dioxin

CAS Registry No: 19408-74-3

Molecular Formula: Cl₃C₆HO₂C₆HCl₃

Molecular Weight: 390.861

Melting Point (°C):

243–244 (Rordorf 1987)

Boiling Point (°C):

487.7 (calculated, Rordorf 1987, 1989)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

207.16 (calculated-liquid density, Govers et al. 1990)

210.16 (liquid molar volume, Govers et al. 1995)

301.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

91.7 (Rordorf 1987)

103.9 (GC-RI correlation, Govers et al. 1995)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

142.922 (Rordorf 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

48.1 (Rordorf 1987)

Entropy of Fusion, ΔS_{fus} (J/mol K):

93 (Rordorf 1987, 1989)

Fugacity Ratio at 25°C, F:

0.00027 (calculated, Passivirta et al. 1999)

Water Solubility (g/m³ or mg/L at 25°C and the reported temperature dependence equations):

6.34×10^{-4} (calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(\text{mol/L})] = 0.491 - 2515/(T/K)$ (liquid, Passivirta et al. 1999)

1.10×10^{-3} , 6.34×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations.):

6.50×10^{-9} , 5.60×10^{-7} , 2.60×10^{-5} , 7.00×10^{-4} , 1.30×10^{-2} (25, 50, 75, 100, 125°C, predicted-vapor pressure correlation method, Rordorf 1985a,b, 1987, 1989)

1.38×10^{-6} (calculated-SOFA model, Govers & Krop 1998)

4.51×10^{-5} ; 1.22×10^{-8} (supercooled liquid P_L; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/\text{Pa}) = 12.93 - 6211/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/\text{Pa}) = 8.07 - 3699/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

8.51×10^{-7} , 1.38×10^{-6} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Henry's Law Constant (Pa m³/mol at 25°C and the reported temperature dependence equations):

0.832 (calculated-SOFA model, Govers & Krop 1998)

$\log [H/(\text{Pa m}^3/\text{mol})] = 7.58 - 1184/(T/K)$ (Passivirta et al. 1999)

0.417; 0.832 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, log K_{ow}:

6.90 (calculated, Broman et al. 1991)

- 8.02 (calculated-SOFA model, Govers & Krop 1998)
- 7.76 (estimated-solubility S_L and regression eq. using lit. K_{OW} values, Passivirta et al. 1999)
- 7.61 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
- 7.95; 8.02 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)
- 7.58 (calculated-QSPR: GRNN model General Regression Neural Network, Zheng et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 12.26 (7°C, GC-retention time correlation, Harner et al. 2000)
- 11.01 (GC-retention time indices correlation, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$:

- 2.95 (guppy exposed to fly ash extract, Opperhuizen et al. 1986)
- 3.50, 4.02 (goldfish: PBO treated, control fish, 120-h exposure, Sijm et al. 1993)
- 4.93; 4.34 (guppies, 21-d exposure, lipid wt: system I - absence of sediment; system II - with presence of sediment, Loonen et al. 1994a)
- 4.99; 4.94; 5.02 (guppies, 21-d exposure, lipid wt basis: measured- C_{fish}/C_W ; calculated; rate constant ratio k_1/k_2 from nonlinear regression analysis, Loonen et al. 1994b)
- 5.18 (calculated-SOFA model, Govers & Krop 1998)
- 5.29 (fish muscle $\log BCF_L$ calculated from water, Wu et al. 2001)

Sorption Partition Coefficient, $\log K_{OC}$:

- 6.69 (organic carbon, calculated-QSAR, Fiedler & Schramm 1990)
- 6.60 (Baltic Sea particulate field samples, concn distribution-GC/MS, Broman et al. 1991)
- 9.45 (calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photolytic $t_{1/2} = 5.4$ h when exposed to sunlight in hexane solution (Doobs & Grant 1979)

photolytic degradation $t_{1/2} = 17.1$ h in extract from fly ash exposed to UV light from a distance of 20 cm in tetradecane solution (Tysklind & Rappe 1991)

$t_{1/2} = 92.4$ h on spruce needle surface under sunlight irradiation (Niu et al. 2003).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

k (oxidative degradation rate constant of water dissolved PCDD) is $5.02 \times 10^4 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline condition at pH 10 and 20°C (Palauschek & Scholz 1987)

$k_{OH}(\text{calc}) = (4.6 - 5.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (4.6 - 10) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime of 1.5 – 3.4 d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ for a hexa-chlorinated dioxin at room temp. (Atkinson 1991)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 200 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.210 \text{ d}^{-1}$ (guppy, Opperhuizen et al. 1986)

$k_1 = 48, 433 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.44, < 0.1 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated, control goldfish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 58 \text{ L kg}^{-1} \text{ d}^{-1}$, $299 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $H_6\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_1 = 687 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.074 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

$k_2 = 0.0057 \text{ d}^{-1}$ with $t_{1/2} = 52 \text{ d}$ (blue mussel, 99-d exposure, Hektoen et al. 1994)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of 1.5×10^6 molecule cm^{-3} , the tropospheric lifetime of a hexa-chlorinated dioxin was calculated to be 1.5–3.4 d for the gas-phase reaction with the OH radical (Atkinson 1991)

$t_{1/2} = 740$ h at 7°C for Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: suggested $t_{1/2} = 14800$ h at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200$ yr in sediment for all homologues (estimated, Suzuki et al. 2000);

$t_{1/2} = 2400000$ h at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000).

Soil: degradation $t_{1/2} = 10\text{--}100$ yr in soil for all homologues (estimated, Suzuki et al. 2000);

$t_{1/2} = 2400\,000$ h at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000).

Biota: half-lives in gold fish: 1.6 d for PBO treated and $t_{1/2} > 7$ d for control fish in 120-h exposure studies (Sijm et al. 1993);

$t_{1/2} = 52$ d in blue mussel for 99-d exposure experiment (Hektoen et al. 1994).

8.1.1.23 1,2,4,6,7,9-Hexachlorodibenzo-*p*-dioxin

Common Name: 1,2,4,6,7,9-Hexachlorodibenzo-*p*-dioxin

Synonym: 1,2,4,6,7,9-H₆CDD

Chemical Name: 1,2,4,6,7,9-hexachlorodibenzo-*p*-dioxin

CAS Registry No: 39227-62-8

Molecular Formula: Cl₃C₆HO₂C₆HCl₃

Molecular Weight: 390.861

Melting Point (°C):

238–240 (Pohland & Yang 1972, Rordorf 1987)

Boiling Point (°C):

487.7 (calculated, Rordorf 1987,1989)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

215.5 (calculated-liquid density, Govers et al. 1990)

302.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

92.1 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

143.238 (Rordorf 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

48.1 (Rordorf 1987)

Entropy of Fusion, ΔS_{fus} (J/mol K):

94 (Rordorf 1987, 1989)

Fugacity Ratio at 25°C, F:

Water Solubility (g/m³ or mg/L at 25°C):

0.00187 (calculated-SOFA model, Govers & Krop 1998)

1.71 × 10⁻³, 1.87 × 10⁻³ (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations.):

6.80 × 10⁻⁹, 5.9 × 10⁻⁷, 2.7 × 10⁻⁵, 7.5 × 10⁻⁴, 1.40 × 10⁻² (25, 50, 75, 100, 125°C, predicted-vapor pressure correlation method, Rordorf 1985a,b, 1987, 1989)

1.41 × 10⁻⁶ (supercooled liquid P_L, calculated-SOFA model, Govers & Krop 1998)

1.35 × 10⁻⁶, 1.41 × 10⁻⁶ (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Henry's Law Constant (Pa m³/mol at 25°C):

0.0282 (calculated-SOFA model, Govers & Krop 1998)

0.479; 0.0282 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, log K_{ow}:

7.85 (shake flask/slow stirring-GC/MS, mixture of fly-ash extract, Sijm et al. 1989a)

7.73 (calculated-SOFA model, Govers & Krop 1998)

7.84; 7.73 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

6.85; 7.05, 7.26, 6.96, 7.30 (observed; calculated-QSPR: PLS, BPN GRNN, MOD models, Zheng et al. 2003)

Octanol/Air Partition Coefficient, log K_{OA}:

Bioconcentration Factor, log BCF:

5.36 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, log K_{OC} :

8.99 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photolytic $t_{1/2} = 47$ h when exposed to sunlight in hexane solution (Doobs & Grant 1979); solution photolysis $t_{1/2} = 764$ min in *n*-hexadecane at 1.0 m from a GE Model RS sunlamp and surface photolysis $t_{1/2} = 7870$ min on a clean glass surface under the same conditions (Nestrick et al. 1980)

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (4.6 - 5.4) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (4.6 - 10) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 1.5\text{--}3.4$ d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a hexa-chlorinated dioxin at room temp. (Atkinson 1991)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 88, 82 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.62, > 0.8 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated, control goldfish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 58 \text{ L kg}^{-1} \text{ d}^{-1}$, $299 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $H_6\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$, the tropospheric lifetime of a hexa-chlorinated dioxin was calculated to be 1.5–3.4 d for the gas-phase reaction with the OH radical (Atkinson 1991)

Surface water:

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}100$ yr in sediment for all homologues (estimated, Suzuki et al. 2000).

Soil: degradation $t_{1/2} = 10\text{--}100$ yr in soil or all homologues (estimated, Suzuki et al. 2000).

Biota: half-lives in gold fish: $t_{1/2} = 1.1$ d for PBO treated and $t_{1/2} < 0.9$ d for control fish in 120-h exposure studies (Sijm et al. 1993).

8.1.1.24 1,2,3,4,6,7,8-Heptachlorodibenzo-*p*-dioxin

Common Name: 1,2,3,4,6,7,8-Heptachlorodibenzo-*p*-dioxin

Synonym: 1,2,3,4,6,7,8-H₇CDD

Chemical Name: 1,2,3,4,6,7,8-heptachlorodibenzo-*p*-dioxin

CAS Registry No: 35822-46-9

Molecular Formula: Cl₇C₆H₂O₂Cl₄

Molecular Weight: 425.308

Melting Point (°C):

264–265 (Rordorf 1987,1989; Delle Site 1997)

Boiling Point (°C):

507.2 (Rordorf 1987,1989)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

218.32 (calculated-liquid density, Govers et al. 1990)

323.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

92.5 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

149.792 (Rordorf 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

53.9 (Rordorf 1987; quoted, Ruelle & Kesselring 1997)

30.42 (Friesen & Webster 1990)

Entropy of Fusion, ΔS_{fus} (J/mol K):

100 (Rordorf 1987,1989; quoted, Passivirta et al. 1999)

Fugacity Ratio at 25°C, F: 0.00442 (assuming ΔS_{fus} = 56 J/mol K and mp at 265°C)

0.00423 (calculated-assuming ΔS_{fus} = 56 J/mol K, Shiu et al. 1988)

6.11 × 10⁻⁵ (calculated-ΔS_{fus} and mp, Passivirta et al. 1999)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2.40 × 10⁻⁶*, 2.42 × 10⁻⁶ (20°C, ¹⁴C-labeled, generator column-HPLC/LSC, measured range 20–40°C, calculated, Friesen et al. 1985)

2.30 × 10⁻⁶* (21°C, generator column-HPLC/LSC, measured range 7–41°C, Friesen & Webster 1990)

log [S_L/(mol/L)] = 0.391 – 2820/(T/K) (supercooled liquid, Passivirta et al. 1999)

3.15 × 10⁻⁴ (supercooled liquid S_L, GC-RI correlation, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

7.5 × 10⁻¹⁰* (predicted-vapor pressure correlation method, Rordorf 1985a,b, 1987,1989)

3.20 × 10⁻⁸ (gas saturation, estimated from vapor pressure vs. temperature plot, Rordorf et al. 1986)

1.02 × 10⁻⁶ (supercooled liquid P_L, GC-RT correlation, Eitzer & Hites 1988, 1991)

1.19 × 10⁻⁶ (supercooled liquid, GC/MS, Eitzer & Hites 1989)

3.20 × 10⁻⁹ (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)

4.41 × 10⁻⁹, 5.15 × 10⁻⁹ (solid P_s, calculated from reported P_L, Delle Site 1997)

8.97 × 10⁻⁶ (corrected supercooled liquid P_L, Eitzer & Hites 1998)

6.03 × 10⁻⁷; 5.89 × 10⁻⁷ (supercooled liquid P_L, quoted exptl., calculated-SOFA model, Govers & Krop 1998)

8.97 × 10⁻⁶; 6.79 × 10⁻¹⁰ (supercooled liquid P_L; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/\text{Pa}) = 13.18 - 6661/(T/\text{K})$ (solid, Passivirta et al. 1999)
 $\log (P_L/\text{Pa}) = 7.95 - 3844/(T/\text{K})$ (supercooled liquid, Passivirta et al. 1999)
 $\log (P/\text{Pa}) = 17.10357 - 7820.06/(T/\text{K})$ temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)
 2.04×10^{-7} , 5.89×10^{-7} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C and the reported temperature dependence equations):

0.133 (calculated-P/C, Shiu et al. 1988)
 4.25 (computed-expert system SPARC, Kollig 1995)
 0.832 (calculated-SOFA model, Govers & Krop 1998)
 $\log [H/(\text{Pa m}^3/\text{mol})] = 7.56 - 7024/(T/\text{K})$ (Passivirta et al. 1999)
 0.275; 0.832 (GC-RI correlation; calculated-SOFA, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

11.29, 11.42, 11.90; 11.03, 11.50, 11.98 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)
 11.05, 11.50 (HPLC-RT correlation, Sarna et al. 1984)
 11.38, 10.55; 11.05, 9.69 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)
 8.20 (HPLC-RT correlation, Burkhard & Kuehl 1986)
 11.03 (Hansch et al. 1995)
 8.85 (computed-expert system SPARC, Kollig 1995)
 8.40 (calculated-SOFA model, Govers & Krop 1998)
 8.31 (estimated-solubility S_L and regression eq. using lit. K_{ow} values, Passivirta et al. 1999)
 8.051 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
 8.27; 8.40 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)
 7.66, 7.43, 8.18, 7.73 (calculated-QSPR: PLS, BPN GRNN, MOD models, Zheng et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

11.42*; 10.73 (generator column-GC, measured range 20–50°C, calculated, Harner et al. 2000)
 $\log K_{OA} = -3.51 + 4450/(T/\text{K})$; temp range 30–50°C (Harner et al. 2000)

Bioconcentration Factor, $\log BCF$:

3.32, 3.74 (fathead minnow, rainbow trout, steady-state, wet weight, Muir et al. 1985)
 3.32, 4.32 (fathead minnow, wet wt. based, lipid based, quoted, Gobas & Schrap 1990)
 2.92, 4.28 (goldfish: PBO treated, control fish, 120-h exposure, Sijm et al. 1993)
 4.68 (guppy, Loonen et al. 1994)
 4.68; 4.08 (guppy, 21-d exposure, lipid wt: system I - absence of sediment; system II - with presence of sediment, Loonen et al. 1994a)
 4.68; 4.68; 4.76 (guppies, 21-d exposure, lipid wt basis: measured- C_{fish}/C_w ; calculated; rate constant ratio k_1/k_2 from non-linear regression analysis, Loonen et al. 1994b)
 4.68; 4.79 (lipid wt base, quoted exptl., calculated-SOFA model, Govers & Krop 1998)
 6.11, 6.34 (fish muscle $\log BCF_L$ calculated from water, calculated from sediment, Wu et al. 2001)

Sorption Partition Coefficient, $\log K_{oc}$:

6.69 (organic carbon, calculated-QSAR, Fiedler & Schramm 1990)
 5.47 (DOC, De Voogt et al. 1990)
 7.80 (Baltic Sea particulate field samples, concn distribution-GC/MS, Broman et al. 1991)
 10.95; 10.0 (sediment/water, quoted exptl., calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

photolytic $t_{1/2} = 11$ h in *n*-hexane solution to natural sunlight as well as to fluorescent black light (Dobbs & Grant 1979; quoted, Choudhary & Webster 1982)
 solution photolysis $t_{1/2} = 1800$ min at 1.0 m from a GE Model sunlamp and surface photolysis $t_{1/2} = 3140$ min on clean soft glass surface under the same conditions (Nestrick et al. 1980)

$t_{1/2} = 30$ h in *n*-hexadecane solution (Mamantov 1984);

first order $k = 1.02 \times 10^{-6} \text{ s}^{-1}$ in water-acetonitrile (2:3, v/v) at 313 nm and calculated direct sunlight photolysis half-lives in aquatic bodies at latitude 40°N for various seasons: $t_{1/2} = 56.46$ d in spring; $t_{1/2} = 47.33$ d in summer; $t_{1/2} = 87.86$ d in autumn, $t_{1/2} = 155.79$ d in winter and averaged $t_{1/2}$ 2993 d over full year (Choudhary & Webster 1985b, 1986)

photolysis $k = 1.02 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 191$ h in water-acetonitrile solution (2:3, v/v) at 313 nm and the calculated midday, mid-season direct sunlight photolysis first-order rate constant in aquatic bodies for various seasons: $k = 1.24 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 57$ d in spring, $k = 1.48 \times 10^2 \text{ d}^{-1}$ $t_{1/2} = 47$ d in summer, $k = 0.80 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 88$ d in autumn, $k = 0.45 \times 10^2 \text{ d}^{-1}$ $t_{1/2} = 156$ d in winter (Choudhary & Webster 1989)

sunlight photolysis $k = 0.28 \text{ d}^{-1}$ in filtered and sterilized natural water and $k = 0.019 \text{ d}^{-1}$ in (2:32, v/v) distilled water-acetonitrile solution at 50°N (Friesen et al. 1990)

photolytic $t_{1/2} = 53.4$ for native congener and $t_{1/2} = 32.6$ h in ^{13}C -labeled congener in extract from fly ash (Tysklind & Rappe 1991)

tropospheric lifetime was calculated based on the gas-phase reaction rate constant $k = (4.6\text{--}10) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with the OH radicals to be 1.5–2.4 d (Atkinson 1991)

photodegradation rate constant $k = 0.18 \text{ h}^{-1}$ with $t_{1/2} = 3.9$ h when loaded on TiO_2 film under UV ($\lambda > 300$ nm) or solar light irradiation in the air (Choi et al. 2000)

$t_{1/2} = 83.5$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

k (oxidative degradation rate constant of water dissolved PCDD by ozone) is $5.46 \times 10^4 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline condition at pH 10 and 20°C (Palauscek & Scholz 1987)

$k_{\text{OH}}(\text{calc}) = 3.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 4.4$ d based on gas phase OH reactions and a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a heptachlorinated dioxin at room temp. (Atkinson 1991)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 56 \text{ d}^{-1}$; $k_2 = 0.042 \text{ d}^{-1}$ (rainbow trout exposed to concn of 11, 55 pg/L, Muir et al. 1985)

$k_1 = 19 \text{ d}^{-1}$; $k_2 = 0.040 \text{ d}^{-1}$ (fathead minnow exposed to concn of 8, 39 pg/L, Muir et al. 1985)

$k_2 = 0.048 \text{ d}^{-1}$ (fathead minnow, Muir & Yarechewski 1988)

$k_2 = 0.0092 \text{ d}^{-1}$ (fathead minnow, quoted, Opperhuizen & Sijm 1990)

$k_2 = 0.0110 \text{ d}^{-1}$ (rainbow trout, quoted, Opperhuizen & Sijm 1990)

$k_1 = 32, 150 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.49, > 0.12 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated, control goldfish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 23 \text{ L kg}^{-1} \text{ d}^{-1}$, $167 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for P_5CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_1 = 456 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.081 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

$k_2 = 0.0061 \text{ d}^{-1}$ with $t_{1/2} = 49$ d (blue mussel, 99-d exposure, Hektoen et al. 1994)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$, the tropospheric lifetime $\tau = 4.4$ d for a hepta-PCDD for the gas-phase reaction with OH radicals (Atkinson 1991);

suggested $t_{1/2} = 1500$ h at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000);

first-order photodegradation $k = 0.19 \text{ h}^{-1}$ with $t_{1/2} = 3.9$ h when loaded on TiO_2 film under UV ($\lambda > 300$ nm) or solar light irradiation in the air (Choi et al. 2000).

Surface water: $t_{1/2} = 11$ h in *n*-hexane solution to natural sunlight as well as to fluorescent black light (Dobbs & Grant 1979; quoted, Choudhary & Webster 1982);

direct sunlight photolysis half-lives in aquatic bodies at latitude 40°N for various seasons: $t_{1/2} = 56.46$ d in spring; $t_{1/2} = 47.33$ d in summer; $t_{1/2} = 87.86$ d in autumn; $t_{1/2} = 155.79$ d in winter and averaged $t_{1/2} = 2393$ d over full year (Choudhary & Webster 1985b, 1986);

photolysis $t_{1/2} = 190.97$ h in water-acetonitrile (2:3, v/v) at 313 nm and the calculated midday, mid-season direct phototransformation half-lives near water bodies at 40°N latitude: $t_{1/2} = 57$ d in spring, $t_{1/2} = 47$ d in summer, $t_{1/2} = 88$ d in fall and $t_{1/2} = 156$ d in winter (Choudhary & Webster 1989);

$t_{1/2} = 81$ d in sunlit filtered and sterilized surface water and $t_{1/2} = 2.5$ d in surface water of actual pond at 50°N latitude (Friesen et al. 1990);

$t_{1/2} = 53.4$ and 32.6 h in native and ^{13}C -labeled congeners, respectively, in extract from fly ash (Tysklind & Rappe 1991);

suggested $t_{1/2} = 30000$ h at 7°C for Baltic Proper environments (Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: degradation $t_{1/2} = 20$ –200 yr in sediment for all homologues (estimated, Suzuki et al. 2000);

suggested $t_{1/2} = 900000$ h at 7°C for Baltic Proper environments (Sinkkonen & Passivirta 2000).

Soil: degradation $t_{1/2} = 10$ –100 yr in soil (estimated, Suzuki et al. 2000);

suggested $t_{1/2} = 900000$ h at 7°C for Baltic Proper environments (Sinkkonen & Passivirta 2000).

Biota: $t_{1/2} = 17.2$ d in fathead minnow (Adams et al. 1986);

$t_{1/2} > 336$ d in carp (Kuehl et al. 1987);

$t_{1/2} = 39$ d in whole body of rainbow trout (Muir et al. 1988; quoted, Muir et al. 1990);

$t_{1/2} = 27.2$ d in lactating cows (Olling et al. 1991);

half-lives in gold fish: $t_{1/2} = 1.4$ d for PBO treated and $t_{1/2} = 5.6$ d for control fish in 120-h exposure studies (Sijm et al. 1993);

$t_{1/2} = 49$ d in blue mussel for 99-d exposure experiment (Hektoen et al. 1994).

TABLE 8.1.1.24.1

Reported aqueous solubilities, vapor pressures and octanol-air partition coefficients of 1,2,3,4,6,7,8-heptachlorodibenzo-*p*-dioxin at various temperatures

Aqueous solubility				Vapor pressure		log K_{OA}	
Friesen et al. 1985		Friesen & Webster 1990		Rordorf 1987, 1989		Harner et al. 2000	
generator column-HPLC/LSC		generator column-HPLC/LSC		gas saturation-GC		generator column-GC/ECD	
t/°C	S/g·m ⁻³	t/°C	S/g·m ⁻³	t/°C	P/Pa	t/°C	log K_{OA}
20	2.40×10^{-6}	7	9.35×10^{-7}	25	7.5×10^{-10}	20	11.66
40	6.30×10^{-5}	11	1.14×10^{-6}	50	8.0×10^{-8}	40	10.774
		17	1.29×10^{-6}	75	4.4×10^{-6}	50	10.225
		21	2.30×10^{-6}	100	1.4×10^{-4}	25	11.42
		26	2.56×10^{-6}	125	2.9×10^{-3}		
		41	6.34×10^{-5}				
		$\Delta H_{sol}/(\text{kJ mol}^{-1}) = 42.4$		$\Delta H_v/(\text{kJ mol}^{-1}) = 92.5$		$\log K_{OA} = a + b/(T/K)$	
		7–41 °C		$\Delta H_{subl}/(\text{kJ mol}^{-1}) = 149.79$		a	–3.51
				$\Delta H_{fus}/(\text{kJ mol}^{-1}) = 53.9$		b	4450
				$\Delta S_{fus}/(\text{J mol}^{-1} \text{K}^{-1}) = 100$		enthalpy of phase change	
						$\Delta H_{OA}/(\text{kJ mol}^{-1}) = 85.10$	

FIGURE 8.1.1.24.1 Logarithm of mole fraction solubility, vapor pressure and K_{OA} versus reciprocal temperature for 1,2,3,4,6,7,8-heptachlorodibenzo-*p*-dioxin.

8.1.1.25 1,2,3,4,7,8,9-Heptachlorodibenzo-*p*-dioxin

Common Name: 1,2,3,4,7,8,9-Heptachlorodibenzo-*p*-dioxin

Synonym: 1,2,3,4,7,8,9-H₇CDD

Chemical Name: 1,2,3,4,7,8,9-heptachlorodibenzo-*p*-dioxin

CAS Registry No:

Molecular Formula: Cl₇C₆H₂O₂Cl₄

Molecular Weight: 425.308

Melting Point (°C):

Boiling Point (°C):

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

222.55 (calculated-liquid density, Govers et al. 1990)

323.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F:

Water Solubility (g/m³ or mg/L at 25°C):

4.57 × 10⁻⁴ (supercooled liquid S_L, calculated-SOFA model, Govers & Krop 1998)

3.97 × 10⁻⁴, 4.57 × 10⁻⁴ (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Vapor Pressure (Pa at 25°C):

3.39 × 10⁻⁷ (supercooled liquid S_L, calculated-SOFA model, Govers & Krop 1998)

2.57 × 10⁻⁷, 3.39 × 10⁻⁷ (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Henry's Law Constant (Pa m³/mol):

0.309 (calculated-SOFA model, Govers & Krop 1998)

0.295; 0.309 (GC-RI correlation; calculated-SOFA, Wang & Wong 2002)

Octanol/Water Partition Coefficient, log K_{OW}:

8.25 (calculated-SOFA model, Govers & Krop 1998)

8.22; 8.25 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Air Partition Coefficient, log K_{OA}:

Bioconcentration Factor, log BCF:

4.95 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, log K_{OC}:

9.75 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k, or Half-Lives, t_{1/2}:

Volatilization:

Photolysis: photolytic t_{1/2} = 27 h when exposed to sunlight in hexane solution (Dobbs & Grant 1979)

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO₃} with NO₃ radical and k_{O₃} with O₃ or as indicated, *data at other temperatures see reference:

k (oxidative degradation rate constant of water dissolved PCDD by ozone) is $5.46 \times 10^4 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline condition at pH 10 and 20°C (Palauscek & Scholz 1987)

$k_{\text{OH}}(\text{calc}) = 3.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 4.4 \text{ d}$ based on gas phase OH reactions and a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a heptachlorinated dioxin at room temp. (Atkinson 1991)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 12 \text{ L kg}^{-1} \text{ d}^{-1}$, $183 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 1.3 \text{ d}^{-1}$, $>3.4 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control goldfish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 22 \text{ L kg}^{-1} \text{ d}^{-1}$, $167 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for H_7CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$, the tropospheric lifetime of a hepta-PCDD was calculated to be 4.4 d for the gas-phase reaction with OH radical (Atkinson 1991)

Surface water:

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200 \text{ yr}$ in sediment for all homologues (estimated, Suzuki et al. 2000)

Soil: degradation $t_{1/2} = 10\text{--}100 \text{ yr}$ in soil (estimated, Suzuki et al. 2000)

Biota: half-lives in gold fish: $t_{1/2} = 0.5 \text{ d}$ for PBO treated and $t_{1/2} < 0.2 \text{ d}$ for control fish in 120-h exposure studies (Sijm et al. 1993).

8.1.1.26 Octachlorodibenzo-*p*-dioxin

Common Name: Octachlorodibenzo-*p*-dioxin

Synonym: O₈CDD, OCDD

Chemical Name: octachlorodibenzo-*p*-dioxin

CAS Registry No: 3268-87-9

Molecular Formula: C₁₂Cl₈O₂, Cl₄C₆O₂C₆Cl₄

Molecular Weight: 459.751

Melting Point (°C):

331 (Lide 2003)

Boiling Point (°C):

510 (Rordorf 1987, 1989)

Density (g/cm³ at 20°C):

Molar Volume (cm³/mol):

229.6, 229.11 (calculated-liquid density, crystalline volume, Govers et al. 1990)

237.21 (liquid molar volume, Govers et al. 1995)

344.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

86.7 (Rordorf 1987)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

151.13 (Rordorf 1987)

145.7 (Li et al. 2004)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

61.4 (Rordorf 1986, 1987; quoted, Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

102 (Rordorf 1986, 1987, 1989; Passivirta et al. 1999)

Fugacity Ratio at 25°C, F: 0.000995 (assuming ΔS_{fus} = 56 J/mol K and mp at 331°C)

0.00107 (calculated-assuming ΔS_{fus} = 56 J/mol K, Shiu et al. 1987)

0.00115 (calculated-assuming ΔS_{fus} = 56 J/mol K, Shiu et al. 1988)

3.46 × 10⁻⁶ (calculated-ΔS_{fus} and mp, Passivirta et al. 1999)

Water Solubility (g/m³ or mg/L at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

2.0 × 10⁻⁶ (Barrie et al. 1983)

4.0 × 10⁻⁷ (¹⁴C-labeled, generator column-HPLC/LSC, Webster et al. 1983)

4.0 × 10^{-7*} (20°C, ¹⁴C-labeled, generator column-HPLC/LSC, measured range 20–40°C, Friesen et al. 1985)

4.0 × 10^{-7*} (20°C, ¹⁴C-labeled, generator column-HPLC/LSC, measured range 20–40°C, Webster et al. 1985)

1.8 × 10⁻⁴ (Opperhuizen 1986)

1.0 × 10⁻⁷ (¹⁴C-labeled-LSC, Srinivasan & Fogler 1987)

7.4 × 10^{-8*} (extrapolated, generator column-GC/ECD, measured range 40–80°C, Doucette & Andren 1988a)

S/(mol/L) = 8.32 × 10⁻⁶ exp(0.041·t/°C) (generator column-GC/ECD, temp range 40–80°C, Doucette & Andren 1988a)

log x = -3891/(T/K) - 1.482; temp range 40–80°C (generator column-GC/ECD, Doucette & Andren 1988a)

log [S_L/(mol/L)] = -0.163 - 3212/(T/K) (supercooled liquid, Passivirta et al. 1999)

1.03 × 10⁻⁴ (supercooled liquid S_L, GC-RI correlation; Wang & Wong 2002)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 2.40×10^{-5} , 1.8×10^{-5} (quoted, calculated-volatilization rate, Dobbs & Cull 1982)
- 8.70×10^{-6} (20°C, gas saturation, Webster et al. 1985)
- 1.10×10^{-10} * (gas saturation, Rordorf 1985a,b, 1986a,b, 1987, 1989)
- 2.51×10^{-10} (gas saturation, estimated from vapor pressure vs. temperature plot, Rordorf 1986)
- 2.74×10^{-6} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1988)
- 2.77×10^{-7} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1991)
- 2.72×10^{-7} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1989)
- 0.000280* (120.1°C, average value, gas saturation-GC, measured range 120.1–199.7°C, Rordorf 1990)
- 1.60×10^{-10} (gas saturation, estimated from extrapolated vapor pressure vs. halogen substituted no. plot, Rordorf et al. 1990)
- 2.62×10^{-10} , 2.56×10^{-10} (solid P_s , calculated from reported P_L , Delle Site 1997)
- 2.75×10^{-7} (correcting supercooled liquid P_L value of 1988, Eitzer & Hites. 1998)
- 1.82×10^{-7} ; 1.35×10^{-7} (supercooled liquid P_L , quoted exptl., calculated-SOFA model, Govers & Krop 1998)
- 2.75×10^{-7} ; 4.92×10^{-12} (supercooled liquid P_L ; converted to solid P_s with fugacity ratio F , Passivirta et al. 1999)
- $\log (P/\text{Pa}) = 15.81886 - 7629.38/(T/K)$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)
- 0.0912* (175°C, Knudsen effusion method, measured range, 175–220°C, Li et al. 2002)
- $\log (P_s/\text{Pa}) = 13.62 - 7429/(T/K)$ (solid, Passivirta et al. 1999)
- $\log (P_L/\text{Pa}) = 8.32 - 4221/(T/K)$ (supercooled liquid, Passivirta et al. 1999)
- $\ln (P/\text{Pa}) = (32.825 \pm 0.153) - (15773 \pm 72)/(T/K)$; temp range 448–493 K (Knudsen effusion method, Li et al. 2002)
- 6.61×10^{-8} (supercooled liquid P_L , GC-RI correlation, Wang & Wong 2002)
- $\ln (P/\text{Pa}) = 38.156 - 16431/(T/K)$; temp range 298–398 K (regression eq. of Rordorf 1989 data, Li et al. 2004)
- $\ln (P/\text{Pa}) = (36.461 \pm 1.020) - (17529 \pm 487)/(T/K)$; temp range 463–493 K (Knudsen effusion technique, Li et al. 2004)

Henry's Law Constant (Pa m³/mol at 25°C and the reported temperature dependence equations):

- 0.683 (calculated-P/C, Shiu et al. 1987, 1988)
- 1.32; 0.513 (supercooled liquid P_L , quoted exptl., calculated-SOFA model, Govers & Krop 1998)
- $\log [H/(\text{Pa m}^3/\text{mol})] = 8.34 - 1009/(T/K)$ (Passivirta et al. 1999)
- 0.191; 0.513 (GC-RI correlation; calculated-SOFA, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 8.50 (Bruggeman et al. 1984; quoted, Opperhuizen 1986)
- 12.21, 12.60, 12.97; 11.82, 12.72, 13.08 (HPLC-RT correlation, linear; quadratic regressions, Sarna et al. 1984)
- 11.16, 12.72 (HPLC-RT correlation, Sarna et al. 1984)
- 10.56, 7.53 (calculated-TSA, Doucette 1985)
- 12.26, 11.35; 11.76, 10.07 (HPLC-RT correlation, linear; quadratic regressions, Webster et al. 1985)
- 8.60 (HPLC-RT correlation, Burkhard & Kuehl 1986)
- 7.59 (generator column-GC/ECD, Doucette & Andren 1987)
- 7.83 (HPLC-RT correlation, Doucette and Andren 1988b)
- 8.60 (calculated, Endicott & Cook 1994)
- 7.59, 8.60 (quoted, Hansch et al. 1995)
- 9.31 (estimated-solubility S_L and regression eq. using lit. K_{OW} values, Passivirta et al. 1999)
- 8.450 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
- 8.48 (GC-RI correlation, Wang & Wong 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 10.80 (calculated- K_{OW}/K_{AW} , Wania & Mackay 1996)
- 13.0 (7°C, GC-retention time indices correlation, Harner et al. 2000)

Bioconcentration Factor, $\log BCF$:

- 1.93, 3.35 (fathead minnow; rainbow trout, steady-state, wet weight, Muir et al. 1985, 1986)
- 1.53–2.13; 3.35 (fathead minnow, rainbow trout, Muir et al. 1986)

- 1.00, 2.05 (human fat, calculated-lipid base, Geyer et al. 1987)
 0.903, 1.93 (human fat, calculated-wet wt. base, Geyer et al. 1987)
 1.90, 3.10 (guppy: in whole fish, in lipid, Gobas et al. 1987)
 6.33; 5.85 (plant parts, calculated-vapor pressure; calculated-vapor pressure & HLC, Reischl et al. 1989)
 2.85, 3.97 (guppy: wet weight base, lipid weight base, Gobas & Schrap 1990; quoted, Devillers et al. 1996)
 2.85 (predicted for biota held in lake enclosures exposed to water concentration of 0.1 ng/g for 0–10 d, Servos et al. 1992b)
 2.15 (caged invertebrates exposed to water concn. 2.0 ng/L for 0–10 d, Servos et al. 1992b)
 2.32 (caged unionid clams exposed to water concn. 2.9 ng/L for 0–10 d, Servos et al. 1992b)
 2.32 (caged white suckers gill exposed to water concn. 2.9 ng/L for 0–10 d, Servos et al. 1992b)
 1.89 (caged white suckers carcass exposed to water concn. 1.1 ng/L for 0–10 d, Servos et al. 1992b)
 2.42 (caged invertebrates exposed to water concn. 0.6 ng/L for 14–24 d, Servos et al. 1992b)
 2.34 (caged unionid clams exposed to water concn. 0.5 ng/L for 14–24 d, Servos et al. 1992b)
 2.75 (caged white suckers gill exposed to water concn. 1.3 ng/L for 14–24 d, Servos et al. 1992b)
 2.24 (caged white suckers carcass exposed to water concn. 0.4 ng/L for 14–24 d, Servos et al. 1992b)
 3.97 (caged white suckers gill exposed to water concn. 2.8 ng/L for 0–104 d, Servos et al. 1992b)
 3.95 (caged white suckers carcass exposed to water concn. 2.7 ng/L for 0–104 d, Servos et al. 1992b)
 4.13; 3.38 (guppy, 21-d exposure, lipid wt: system I - absence of sediment; system II - with presence of sediment, Loonen et al. 1994a)
 4.13; 4.34; 4.38 (guppy, 21-d exposure, lipid wt basis: measured- $C_{\text{fish}}/C_{\text{W}}$; calculated; rate constant ratio k_1/k_2 from nonlinear regression analysis, Loonen et al. 1994b)
 3.38 (*Poecilia reticulata*, quoted, Devillers et al. 1996)
 4.13; 4.39 (lipid wt base, quoted exptl., calculated-SOFA model, Govers & Krop 1998)
 7.15, 8.45 (fish 5% lipid: BCF_{W} , BCF_{L} , Geyer et al. 2000)
 8.02, 7.53 (fish muscle log BCF_{L} calculated from water, sediment, Wu et al. 2001)

Sorption Partition Coefficient, log K_{OC} :

- 5.92 (estimated DOC partition coeff., Muir et al. 1985)
 7.08 (organic carbon, calculated-QSAR, Fiedler & Schramm 1990)
 5.92 (DOC, De Voogt et al. 1990)
 7.90 (Baltic Sea particulate field samples, concn distribution-GC/MS, Broman et al. 1991)
 10.96; 10.5 (sediment/water, quoted exptl., calculated-SOFA model, Govers & Krop 1998)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

- photolytic $t_{1/2} = 16$ h by both natural sunlight and fluorescent black light in hexane solution, (Dobbs & Grant 1979; quoted, Choudhary & Webster 1982)
 solution photolysis $t_{1/2} = 1460$ min at 1.0 m from a GE Model RS sunlamp and surface photolysis of 46900 min on clean soft glass surface under the same conditions (Nestrick et al. 1980);
 photolysis $t_{1/2} = 24.3$ h in hexadecane solution (Mamantov 1984)
 photolysis $k = 1.06 \times 10^{-6} \text{ s}^{-1}$ in water acetonitrile (2:3, v/v) solution at 313 nm and calculated direct sunlight photolysis half-lives in aquatic bodies at latitude 40°N for various seasons: $t_{1/2} = 20.53$ d in spring; $t_{1/2} = 17.85$ d in summer; $t_{1/2} = 31.26$ d in autumn; $t_{1/2} = 50.45$ d in winter; and $t_{1/2} = 863$ d averaged over full year (Choudhary & Webster 1986; quoted, Muto et al. 1991)
 photolysis rate constant $k = 1.06 \times 10^{-6} \text{ s}^{-1}$ with $t_{1/2} = 183.95$ h in water-acetonitrile solution (2:3, v/v) at 313 nm and the calculated midday, mid-season direct sunlight photolysis first-order rate constant in aquatic bodies for various seasons: $k = 3.45 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 21$ d in spring, $k = 3.97 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 18$ d in summer, $k = 2.27 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 31$ d in fall, $k = 1.40 \times 10^2 \text{ d}^{-1}$ with $t_{1/2} = 50$ d in winter (Choudhary & Webster 1989)
 photolysis decay rate constants when irradiated with UV light at 254 nm: $k(\text{calc}) = 1.77 \times 10^{-5} \text{ s}^{-1}$, $4.62 \times 10^{-5} \text{ s}^{-1}$ for fly ash suspensions in distilled water, $k(\text{calc}) = 1.42 \times 10^{-5} \text{ s}^{-1}$ for fly ash suspensions in water-acetonitrile solution (2:3, v/v), and $k(\text{calc}) = 2.74 \times 10^{-5} \text{ s}^{-1}$ for fly ash suspensions in water-acetonitrile solution (2:3, v/v) with ozone (Muto et al. 1991);

photolytic $t_{1/2} = 37.3$ h-native congener, $t_{1/2} = 29.6$ h for ^{13}C -labeled congener in extract of fly ash and in tetradecane solution (Tysklind & Rappe 1991);

photolysis $k = 1.6 \times 10^{-3} \text{ min}^{-1}$ with $t_{1/2} = 440$ min in pure water, and $k = 1.0 \times 10^{-3} \text{ min}^{-1}$ with $t_{1/2} = 680$ min in 60% acetonitrile/water aqueous solutions at 300 nm (Kim & O'Keefe 2000);

photodegradation $k = 0.12 \text{ h}^{-1}$ with $t_{1/2} = 5.8$ h when loaded on TiO_2 film under UV ($\lambda > 300$ nm) or solar light irradiation in the air (Choi et al. 2000)

$t_{1/2} = 105$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

k (oxidative degradation rate constant of water dissolved OCDD by ozone) is $1.51 \times 10^4 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline condition at pH 10 and 20°C (Palauscek & Scholz 1987)

$k_{\text{OH}}(\text{calc}) = 1.6 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and a calculated tropospheric lifetime $\tau = 9.6$ d based on gas phase OH reactions and a 12-h average daytime OH radical concentration of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ for OCDD at room temp. (Atkinson 1991)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 142 \text{ d}^{-1}$; $k_2 = 0.053 \text{ d}^{-1}$ (fathead minnow, flow-through system, Muir et al. 1985; quoted, Adams et al. 1986)

$k_1 = 11 \text{ d}^{-1}$; $k_2 = 0.12 \text{ d}^{-1}$ (rainbow trout, flow-through system, Muir et al. 1985)

$k_1 = 17, 5.0 \text{ d}^{-1}$; $k_2 = 0.103, 0.142 \text{ d}^{-1}$ (rainbow trout exposed to concn of 20, 415 ng/L, Muir et al. 1986; quoted, Opperhuizen & Sijm 1990)

$k_1 = 142 \text{ d}^{-1}$; $k_2 = 0.053 \text{ d}^{-1}$ (fathead minnow exposed to concn of 9 ng/L, Muir et al. 1986; quoted, Opperhuizen & Sijm 1990)

$k_2 = 0.046 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1986; quoted, Opperhuizen & Sijm 1990)

$k_1 = 984 \text{ d}^{-1}$; $k_2 = 1.4 \text{ d}^{-1}$ (guppy, Gobas & Schrap 1990)

$k_1 = 60 \text{ d}^{-1}$; $k_2 = 0.12 \text{ d}^{-1}$ (filter-feeder, Servos et al. 1992b)

$k_1 = 30 \text{ d}^{-1}$; $k_2 = 0.08 \text{ d}^{-1}$ (small fish, estimated from Muir et al. 1985 and Servos et al. 1989, Servos et al. 1992b)

$k_1 = 275 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 119 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994)

$k_2 = 0.0053 \text{ d}^{-1}$ with $t_{1/2} = 57$ d (blue mussel, 99-d exposure, Hektoen et al. 1994)

Half-Lives in the Environment:

Air: atmospheric lifetime of ~7–8 h for reaction with hydroxyl radicals (Atkinson 1987);

estimated reaction $k = 0.0015 \text{ h}^{-1}$ (Paterson et al. 1990);

photodegradation $t_{1/2} = 270$ h in a rotary photo-reactor adsorbed to clean silica gels by filtered $\lambda < 290$ nm of light (Koester & Hites 1992);

tropospheric lifetime $\tau = 9.6$ d, calculated based on gas-phase reaction with OH radicals (Atkinson 1991);

suggested $t_{1/2} = 3950$ h at 7°C for Baltic Proper environments (Sinkkonen & Passivirta 2000);

first-order photodegradation $k = 0.12 \text{ h}^{-1}$ with $t_{1/2} = 5.8$ h when loaded on TiO_2 film under UV ($\lambda > 300$ nm) or solar light irradiation in the air (Choi et al. 2000).

Surface water: first order photolytic rate constant $k < (0.3 - 2.7) \times 10^{-3} \text{ h}^{-1}$ with $t_{1/2} = 7 - 16$ h exposed to sunlight in hexane solution (Dobbs & Grant 1979);

direct sunlight photolysis half-lives in aquatic bodies at latitude 40°N for various seasons: $t_{1/2} = 20.53$ in spring, $t_{1/2} = 17.85$ d in summer; $t_{1/2} = 31.26$ d in fall; $t_{1/2} = 50.45$ d in winter and $t_{1/2} = 853.22$ d averaged over full year (Choudhary & Webster 1986);

$k = 1.064 \times 10^{-6} \text{ s}^{-1}$ in water-acetonitrile (2:3, v/v) under direct sunlight (Choudhary & Webster 1985a, 1986);

photolysis $t_{1/2} = 183.95$ h in water-acetonitrile solution (2:3, v/v) at 313 nm and the calculated midday, mid-season direct photolysis half-lives near water bodies at 40°N latitude: $t_{1/2} = 21$ d in spring, $t_{1/2} = 18$ d in summer, $t_{1/2} = 31$ d in fall and $t_{1/2} = 50$ d in winter (Choudhary & Webster 1989);

$t_{1/2} = 4.0$ d in the water column of an experimental lake in northwestern Ontario (Servos et al. 1989);

transformation $k(\text{calc}) = 1.6 \times 10^{-3} \text{ h}^{-1}$ in simulated lake enclosure (Servos et al. 1992a);

photolysis $k = 1.6 \times 10^{-3} \text{ min}^{-1}$ with $t_{1/2} = 440$ min in pure water, and $k = 1.0 \times 10^{-3} \text{ min}^{-1}$ with $t_{1/2} = 680$ min in 60% acetonitrile/water aqueous solutions at 300 nm (Kim & O'Keefe 2000);

suggested $t_{1/2} = 79000$ h at 7°C for Baltic Proper environments (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: estimated reaction $k = (5.0 \times 10^{-3} - 1.0 \times 10^{-6}) \text{ h}^{-1}$ (Paterson et al. 1990);

$t_{1/2}(\text{calc}) = 10$ yr with a transformation rate constant $k = 7.9 \times 10^{-6} \text{ h}^{-1}$ (Servos et al. 1992a)

$t_{1/2} = 0.2 - 142$ yr (Geyer et al. 2000)

degradation $t_{1/2} = 20-200$ yr in sediment for all homologues (estimated, Suzuki et al. 2000)

suggested $t_{1/2} = 130000$ h at 7°C for Baltic Proper environments (Sinkkonen & Passivirta 2000).

Soil: undergoes photoreduction on soil surfaces to lower chlorinated congeners (Kieatiwong et al. 1990);

estimated reaction $k = 7.0 \times 10^{-7} \text{ h}^{-1}$ (Paterson et al. 1990)

$t_{1/2} > 10$ yr (Geyer et al. 2000)

degradation $t_{1/2} = 10-100$ yr in soil (estimated, Suzuki et al. 2000)

suggested $t_{1/2} = 130000$ h at 7°C for Baltic Proper environments (Sinkkonen & Passivirta 2000).

Biota: elimination $t_{1/2} \sim 21$ d from rat (Norback et al. 1975; quoted, Birnbaum 1985);

elimination $t_{1/2} = 13.9$ d for fathead minnow (Muir et al. 1985, Adams et al. 1986);

elimination $t_{1/2} = 5-13$ d for both rainbow trout and fathead minnow (Muir et al. 1986);

mean biological $t_{1/2} \sim 15$ d in rainbow trout (Niimi 1986);

$t_{1/2} = 15$ d in rainbow trout (Niimi & Oliver 1986; quoted, Muir et al. 1986,1990);

$t_{1/2} = 57$ d in blue mussel for 99-d exposure experiment (Hektoen et al. 1994).

9.1 LIST OF CHEMICALS AND DATA COMPILATIONS

9.1.1 DIBENZOFURAN AND CHLORINATED DIBENZOFURANS

9.1.1.1 Dibenzofuran

Common Name: Dibenzofuran

Synonym: diphenylene oxide

Chemical Name: dibenzofuran

CAS Registry No: 132-64-9

Molecular Formula: $C_{12}H_8O$, $C_6H_4OC_6H_4$

Molecular Weight: 168.191

Melting Point ($^{\circ}C$):

86.5 (Lide 2003)

Boiling Point ($^{\circ}C$):

287 (Weast 1982–83; Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0886 ($99^{\circ}C$, Weast 1982–83)

Molar Volume (cm^3/mol):

154.4 ($99^{\circ}C$, calculated-density, Stephenson & Malanowski 1987)

147.8 (Ruelle & Kesselring 1997)

176.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

65.4 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

85.63 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

19.6 (Rordorf 1987, 1989; quoted, Ruelle & Kesselring 1997)

18.6 (Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

54 (Rordorf 1986, 1987, 1989)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F : 0.249 (mp at $86.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

3.11 (Lu et al. 1978)

10.03 (shake flask-HPLC/UV, Banerjee et al. 1980)

6.56 (selected average, Pearlman et al. 1984)

4.22* (generator column-GC, measured range $4-39.8^{\circ}C$, Doucette & Andren 1988a)

$S/(mol/L) = 8.32 \times 10^{-6} \exp(0.041 \cdot t/^{\circ}C)$; temp range $4-40^{\circ}C$ (generator column-GC/ECD, Doucette & Andren 1988a); or

$\log x = -1558/(T/K) - 1.135$; temp range $4-40^{\circ}C$ (generator column-GC/ECD, Doucette & Andren 1988a)

3.36 (calculated-TSA, Dickhut et al. 1994)

4.30 (computed-expert system SPARC, Kollig 1995)

$4.75^* \pm 0.22$ (generator column-HPLC/UV, Shiu et al. 1997)

4.69 ± 0.18 (shake flask-GC, Shiu et al. 1997)

2.43 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle Kesselring 1997)

17.21; 62.49 (supercooled liquid S_L , quoted lit. average; calculated-SOFA-Solubility parameters for Fate Analysis model, Govers & Krop 1998)

$\ln x = -1.6385 - 3842.2/(T/K)$; temp range $5-50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

- 0.276* (gas saturation, extrapolated-Antoine eq. from exptl. data, measured temp range, 30–70°C, Hansen & Eckert 1986)
- 0.506* (26°C, gas saturation exptl. data, measured range 49–74°C, Sato et al. 1986)
- 0.466 (gas saturation-GC, extrapolated-Antoine eq. derived from exptl. data, temp range 49–74°C, Sato et al. 1986)
- 0.35* (gas saturation-GC, measured range 25–125°C Rordorf 1986, 1989)
- 2.026 (extrapolated liquid value P_L , Antoine eq., Stephenson & Malanowski 1987)
- $\log(P_L/\text{kPa}) = 5.8968 - 1851.27/(-82.64 + T/K)$; temp range 403–559 K (Antoine eq., Stephenson & Malanowski 1987)
- 0.40 (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)
- $\log(P/\text{mmHg}) = 17.6646 - 3.1989 \times 10^3/(T/K) - 3.3346 \cdot \log(T/K) + 6.0686 \times 10^{-10} \cdot (T/K) + 4.4676 \times 10^{-7} \cdot (T/K)^2$; temp range 356–838 K (vapor pressure eq., Yaws et al. 1994)
- 0.360 (computed-expert system SPARC, Kollig 1995)
- 0.708; 0.123 (supercooled liquid P_L , quoted exptl. or exptl. average; calculated-SOFA model (Solubility parameters of Fate Analysis model), Govers & Krop 1998)
- $\log(P/\text{Pa}) = 13.17192 - 4083/(T/K)$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)
- 0.429 (gas saturation-HPLC/fluorescence, de Seze et al. 2000)
- 0.398* (25.2°C, Knudsen effusion method, measured range 20.2–45°C Li et al. 2002)
- $\ln(P/\text{Pa}) = 33.54 - 10313/(T/K)$; temp range 298–398 K (regression eq. of Rordorf 1989 data, Li et al. 2002 2004)
- $\ln(P/\text{Pa}) = (32.203 \pm 0.576) - (9880.4 \pm 176)/(T/K)$; temp range 295–318 K (Knudsen effusion technique, Li et al. 2004)

Henry's Law Constant (Pa m³/mol at 25°C):

- 14.16 (calculated-P/C with selected values)
- 14.20 (computed-expert system SPARC, Kollig 1995)
- 21.38, 13.80 (calculated-P/C, Govers & Krop 1998)

Octanol/Water Partition Coefficient, $\log K_{OW}$ at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section:

- 4.12 (HPLC-RT correlation, Veith et al. 1979a)
- 4.12 (Hansch & Leo 1979)
- 4.17 (shake flask-HPLC/UV, Banerjee et al. 1980)
- 3.91, 4.12, 4.18; 3.96, 4.10, 4.17 (HPLC-RT, linear regressions; quadratic regressions, Sarna et al. 1984)
- 3.92 (re-evaluated HPLC-RT data, Burkhard & Kuehl 1986)
- 4.31 (generator column-GC/ECD, both phases, Doucette & Andren 1987)
- 3.86 (HPLC-RT correlation, Doucette & Andren 1988b)
- 4.21, 3.81 (shake flask-HPLC, TLC-RT correlation, De Voogt et al. 1990)
- 4.12 (recommended, Sangster 1993)
- 4.12 (recommended, Hansch et al. 1995)
- 4.27 (generator column-HPLC/UV, Shiu et al. 1997)
- 4.273* (shake flask-HPLC/UC, measured S_O and S_W , Shiu et al. 1997)
- 4.09 ± 0.19 , 4.12 ± 0.63 ; 4.12 (HPLC- k' correlation: ODS-65 column, Diol-35 column; quoted lit average value, Helweg et al. 1997)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$:

- 3.13 (fathead minnow, 28 d exposure, Veith et al. 1979b)
- 3.13, 2.80 (quoted exptl., calculated- K_{OW} , Mackay 1982)
- 3.13, 3.13 (quoted exptl., calculated-MCI χ , Sabljic 1987)

- 3.13 (calculated- K_{OW} , Isnard & Lambert 1989)
 3.68; 4.08 (lipid wt basis, quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

Sorption Partition Coefficient, $\log K_{OC}$:

- 3.80 (computed- K_{OW} , Kollig 1995)
 4.15 (humic acid, HPLC- k' correlation, Nielsen et al. 1997)
 3.45 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
 3.84 (soil-pore-water partition coeff. for Askov soil, a Danish agricultural soil, Sverdrup et al. 2002)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = 3.4 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ corresponding to an atmospheric lifetime of about 8 h (Atkinson 1987a)

$k_{OH} = 3.3 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Atkinson 1987b)

$t_{1/2} = 1.9\text{--}19 \text{ h}$ based on estimated rate constant with OH radicals in air (Howard 1991)

$k_{OH} = 31 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ the tropospheric lifetime was calculated to be 0.5 d (Atkinson 1991)

$k_{OH} = 3.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and with calculated tropospheric lifetime of 3.7 d; $k_{NO_3} < 7 \times 10^{-30} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime $>7 \text{ yr}$ and $k_{O_3} < 8 \times 10^{-20} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with O_3 with calculated tropospheric lifetime $>250 \text{ d}$ at room temp. (Kwok et al. 1994)

$k_{OH}(\text{exptl}) = 3.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 7.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ corresponding to a tropospheric lifetime of 3.7 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation: biodegradation $t_{1/2} \sim 168\text{--}672 \text{ h}$ and anaerobic $t_{1/2} = 672\text{--}2688 \text{ h}$, based on aerobic acclimated and unacclimated groundwater die-away test data (Lee et al. 1984; quoted, Ward et al. 1986; Howard et al. 1991); nonautoclaved groundwater samples at hazardous waste site with a concentration of approximate 0.09 mg/L are degraded by microbes at rates about 30% per week while the levels of the controls decreased only about half that rate (Lee et al. 1984).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: the calculated atmospheric lifetime range from $\sim 60\text{--}120 \text{ h}$ (Atkinson 1987a);

$t_{1/2} = 1.9\text{--}19 \text{ h}$, based on estimated rate constants for reaction with OH radicals (Howard et al. 1991);

the tropospheric lifetime was calculated 0.5 d for the gas-phase reaction for OH radicals using a 12-h average daytime OH radical concn of 1.5×10^6 (Atkinson 1991);

calculated room temp. tropospheric lifetimes of 3.7 d for reaction with OH radical, $>7 \text{ yr}$ with NO_3 radical, and $>250 \text{ d}$ for reaction with O_3 (Kwok et al. 1994);

room temp. tropospheric lifetime was calculated to be 3.7 d for reaction with OH radical (Kwok et al. 1995).

Surface water: $t_{1/2} = 168\text{--}672 \text{ h}$, based on aerobic acclimated and unacclimated groundwater die-away test data (Howard et al. 1991).

Groundwater: $t_{1/2} = 205\text{--}835 \text{ h}$, based on aerobic acclimated and unacclimated groundwater die-away test data (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 168\text{--}672 \text{ h}$, based on aerobic acclimated and unacclimated groundwater die-away test data (Howard et al. 1991).

FIGURE 9.1.1.2 Logarithm of vapor pressure versus reciprocal temperature for dibenzofuran.

9.1.1.2 2-Chlorodibenzofuran

Common Name: 2-Chlorodibenzofuran

Synonym: 2-MCDF

Chemical Name: 2-Chlorodibenzofuran

CAS Registry No: 51230-49-0

Molecular Formula: $C_{12}H_7ClO$, $C_6H_4OC_6H_3Cl$

Molecular Weight: 202.637

Melting Point ($^{\circ}C$):

101.5–102.5 (Rordorf 1989)

Boiling Point ($^{\circ}C$):

338.2 (Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

197.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

75.2 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

95.28 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

19.4 (Rordorf 1987, 1989)

Entropy of Fusion, ΔS_{fus} (J/mol K):

52 (Rordorf 1986, 1987, 1989)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

11.66 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

4.23, 11.66 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

9.6×10^{-3} , 0.190, 2.40, 22.0, 150 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1985a,b, 1987, 1989)

0.537 (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

$\log(P_L/mmHg) = 40.57 - 5556/(T/K) - 9.999 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

0.174; 0.537 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

9.12 (calculated-SOFA model, Govers & Krop 1998)

10.23; 9.12 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.37 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)

5.15; 4.37 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

4.51 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)

4.77; 4.51 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

- 4.38 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
3.96; 4.38 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (16-22) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for a mono-chlorinated dibenzofuran, tropospheric lifetime was calculated to be 0.7–1.0 d using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ (Atkinson 1991)

$k_{OH}(\text{calc}) = (5.0-5.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and the calculated tropospheric lifetime was 2.9 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated for a mono-chlorinated dibenzofuran based on the gas-phase reaction with OH radicals to be 0.7–1.0 d (Atkinson 1991);

calculated tropospheric lifetime was 2.9 d for the gas-phase reaction with OH radical (Kwok et al. 1995).

Surface water:

Ground water:

Sediment:

Soil:

Biota:

9.1.1.3 3-Chlorodibenzofuran

Common Name: 3-Chlorodibenzofuran

Synonym: 3-MCDF

Chemical Name: 3-Chlorodibenzofuran

CAS Registry No: 25074-67-3

Molecular Formula: $C_{12}H_7ClO$, $C_6H_4OC_6H_3Cl$

Molecular Weight: 202.637

Melting Point ($^{\circ}C$):

101–102 (Kuroki et al. 1984; Rordorf 1989)

Boiling Point ($^{\circ}C$):

338.2 (Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

197.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

75.2 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

95.313 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

19.4 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} (J/mol K):

52 (Rordorf 1986, 1987, 1989)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

12.21 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

6.34; 12.21 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.970, 0.190, 2.40, 22.0, 150 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1985a,b, 1987, 1989)

0.490 (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

$\log(P_L/mmHg) = 40.57 - 5553/(T/K) - 9.999 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

0.174; 0.490 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

7.76 (calculated-SOFA model, Govers & Krop 1998)

10.23; 7.76 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.35 (lipid wt base, calculated-SOFA model, Govers & Krop 1998)

5.15; 4.35 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

4.53 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)

4.77; 4.53 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

4.34 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

3.96; 4.34 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference: $k_{OH} = (16-22) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for a mono-chlorinated dibenzofuran, tropospheric lifetime was calculated to be 0.7–1.0 d using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ (Atkinson 1991) $k_{OH}(\text{calc}) = (5.0-5.1) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and the calculated tropospheric lifetime was 2.9 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated for a mono-chlorinated dibenzofuran based on the gas-phase reaction with OH radicals to be 0.7–1.0 d (Atkinson 1991);

calculated tropospheric lifetime of 2.9 d for with OH radical (Kwok et al. 1995).

0.0115; 0.0417 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

1.06×10^{-3} (solid P_s , gas saturation-GC/MS, Mader & Pankow 2003)

0.0412 (supercooled liquid P_L , calculated from P_s assuming $\Delta S_{fus} = 56 J/mol K$, Mader & Pankow 2003)

$\log (P_L/mmHg) = 39.21 - 5756/(T/K) - 9.466 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

$\ln(P/\text{Pa}) = 32.943 - 12162/(T/\text{K})$, temp range 298–398 K (regression eq. of Rordorf 1989 data, Li et al. 2004)

$\ln(P/\text{Pa}) = (36.010 \pm 0.393) - (13262 \pm 144)/(T/\text{K})$; temp range 348–383 K (Knudsen effusion technique, Li et al. 2004)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

6.31; 4.57 (quoted lit.; calculated-SOFA model, Govers & Krop 1998)

4.79; 4.57 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

5.56, 5.97, 6.16; 5.65, 5.95, 6.15 (HPLC-RT correlation, linear regressions; quadratic regressions, Sarna et al. 1984)

5.30 (re-evaluated HPLC-RT data, Burkhard & Kuehl 1986)

5.44 (generator column-GC/ECD, Doucette & Andren 1987)

5.12 (HPLC-RT correlation, Doucette & Andren 1988b)

5.65 (recommended, Sangster 1993)

5.65 (recommended, Hansch et al. 1995)

5.42 (GC-RI correlation; Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

Bioconcentration Factor, $\log \text{BCF}$:

5.04 (guppy, Loonen et al. 1994a)

5.04; 4.81 (lipid wt basis, quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

5.04; 4.81 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

5.30 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

5.13; 5.30 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: when 5 mg/L in methanol was irradiated by sunlight simulator more than 95% disappears within 48 h while a similar experiment with highly purified methanol solution reveals only very slow photolysis within the same period of irradiation and results were same with 10 mg/L in methanol solution (Crosby & Moilanen 1973; quoted, Choudhary & Hutzinger 1982);

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}} = (6.6\text{--}16) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for a di-chlorinated dibenzofuran, tropospheric lifetime was calculated to be 1.0–2.3 d using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ (Atkinson 1991)

$k_{\text{OH}}(\text{calc}) = (2.6\text{--}3.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and the calculated tropospheric lifetime was 4.0–5.5 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated based on the gas-phase reaction rate constant for a di-chlorinated PCDF with OH radicals to be 1.0–2.3 d (Atkinson 1991);

tropospheric lifetime was calculated to be 4.0–5.5 d for dichloro-CDFs, for the reaction with OH radicals (Kwok et al. 1995).

Surface water:

Groundwater:

Sediment:

Soil:

Biota: mean biological $t_{1/2} \sim 11$ d in rainbow trout (Niimi 1986).

FIGURE 9.1.6.1 Logarithm of mole fraction solubility and vapor pressure versus reciprocal temperature for 2,8-dichlorodibenzofuran.

9.1.1.7 3,6-Dichlorodibenzofuran

Common Name: 3,6-Dichlorodibenzofuran

Synonym: 3,6-DCDF

Chemical Name: 3,6-dichlorodibenzofuran

CAS Registry No: 94570-83-9

Molecular Formula: $C_{12}H_6Cl_2O$

Molecular Weight: 237.082

Melting Point ($^{\circ}C$):

188 (Rordorf 1989)

Boiling Point ($^{\circ}C$):

357 (Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

218.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

70.7 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

110.87 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

38.1 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} (J/mol K):

83 (Rordorf 1989)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.0252 (mp at $188^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.76 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

0.684; 1.76 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.0×10^{-4} , 6.3×10^{-3} , 0.12, 1.60, 15 (25, 50, 75, 100, $125^{\circ}C$, gas saturation-GC, Rordorf 1985a,b, 1987, 1989)

0.0355 (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

0.0123; 0.0355 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

$\log(P_L/mmHg) = 39.18 - 5755/(T/K) - 9.466 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

4.57 (calculated-SOFA model, Govers & Krop 1998)

4.68; 4.57 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.08 (calculated-SOFA model, Govers & Krop 1998)

5.44; 5.08 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

4.81 (lipid wt. basis, calculated-SOFA model, Govers & Krop 1998)

5.05; 4.81 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, log K_{OC} :

5.35 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

5.18; 5.35 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (6.6-16) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for a di-chlorinated dibenzofuran, tropospheric lifetime was calculated to be 1.0–2.3 d using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ (Atkinson 1991)

$k_{OH}(\text{calc}) = (2.6-3.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and the calculated tropospheric lifetime was 4.0–5.5 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: lifetime was calculated based on the gas-phase reaction rate constant for a di-chlorinated PCDF with OH radicals to be 1.0–2.3 d (Atkinson 1991);

tropospheric lifetime was calculated to be 4.0–5.5 d for dichloro-CDFs, for the reaction with OH radical (Kwok et al. 1995).

$\Delta H_{\text{subl}}/(\text{kJ mol}^{-1}) = 112.3$	
$\Delta H_{\text{fus}}/(\text{kJ mol}^{-1}) = 32.6$	
$\Delta S_{\text{fus}}/(\text{J mol}^{-1} \text{ K}^{-1}) = 76$	

FIGURE 9.1.10.1 Logarithm of vapor pressure versus reciprocal temperature for 2,4,8-trichlorodibenzofuran.

9.1.1.11 1,2,3,4-Tetrachlorodibenzofuran

Common Name: 1,2,3,4-Tetrachlorodibenzofuran

Synonym: 1,2,3,4-TCDF

Chemical Name: 1,2,3,4-tetrachlorodibenzofuran

CAS Registry No: 24478-72-6

Molecular Formula: $C_{12}H_4Cl_4O$, $C_6H_2Cl_2OC_6H_2Cl_2$

Molecular Weight: 305.978

Melting Point ($^{\circ}C$):

168.5–169 (Kuroki et al. 1984; Rordorf 1989)

Boiling Point ($^{\circ}C$):

438.3 (Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

260.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

84.4 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

122.826 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

36.6 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} (J/mol K):

83 (Rordorf 1989)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0717 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

0.0306; 0.0717 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

4.1×10^{-6} , 1.9×10^{-4} , 5.1×10^{-3} , 8.7×10^{-2} , 1.0 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

6.76×10^{-4} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

$\log(P_L/mmHg) = 36.02 - 6019/(T/K) - 8.399 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

1.17×10^{-4} , 6.76×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

2.75 (calculated-SOFA model, Govers & Krop 1998)

1.74; 2.75 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.17 (shake flask/slow stirring-GC/MS, Sijm et al. 1989)

6.34 (calculated-SOFA model, Govers & Krop 1998)

6.07; 6.34 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 4.92 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
 5.22; 4.92 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

- 7.12 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
 7.18; 7.12 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: sunlight induced photolysis $t_{1/2} = 220$ min in isooctance solution, and solid phase photolysis half-life, $t_{1/2} = 95$ h with PCDF dispersed as solid films (Buser 1988)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (1.4\text{--}8.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for a tetra-chlorinated dibenzofuran, tropospheric lifetime was calculated to be 1.9–11 d using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ (Atkinson 1991)

$k_{OH}(\text{calc}) = (0.8\text{--}1.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and the calculated tropospheric lifetime was 7.7–18 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 154, 134 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 > 1.8, > 1.4 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 171 \text{ L kg}^{-1} \text{ d}^{-1}, 220 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for P_5 CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$, the tropospheric lifetime of a tetra-PCDF for the gas-phase reaction with OH radical was calculated to be 1.9–11 d (Atkinson 1991); calculated room temp. tropospheric lifetime of 7.7–18 d for tetrachloro-DCF_s for the gas-phase reaction with OH radical (Kwok et al. 1995).

Surface water:

Ground water:

Sediment: degradation $t_{1/2} = 20\text{--}200$ yr in sediment for all homologues (Suzuki et al. 2000)

Soil:

Biota: half-lives in gold fish: $t_{1/2} < 0.4$ d for PBO treated and $t_{1/2} > 0.5$ d for control fish in 120-h exposure studies (Sijm et al. 1993).

9.1.1.12 1,2,3,7-Tetrachlorodibenzofuran

Common Name: 1,2,3,7-Tetrachlorodibenzofuran

Synonym: 1,2,3,7-TCDF

Chemical Name: 1,2,3,7-tetrachlorodibenzofuran

CAS Registry No: 83704-22-7

Molecular Formula: $C_{12}H_4Cl_4O$, $C_6H_2Cl_2OC_6H_2Cl_2$

Molecular Weight: 305.978

Melting Point ($^{\circ}C$):

167.5–168 (Kuroki et al. 1984; Rordorf 1989)

Boiling Point ($^{\circ}C$):

438.3 (Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

260.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

84.4 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

122.879 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

36.6 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} (J/mol K):

83 (Rordorf 1989)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0805 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

0.0306; 0.0805 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

4.2×10^{-6} , 1.9×10^{-4} , 5.2×10^{-3} , 8.9×10^{-2} , 1.1 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

7.08×10^{-4} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

1.41×10^{-4} , 7.08×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

$\log(P_L/mmHg) = 36.07 - 6015/(T/K) - 8.399 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated):

2.57 (calculated-SOFA model, Govers & Krop 1998)

1.78; 2.57 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.31 (calculated-SOFA model, Govers & Krop 1998)

6.04; 6.31 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.41 (gold fish treated with metabolic inhibitor PBO, 120-h exposure, Sijm et al. 1993)

4.93 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)

5.23; 4.93 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

7.07 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

7.10; 7.07 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: sunlight induced photolysis $t_{1/2} = 220$ min in isooctane solution, and solid phase photolysis $t_{1/2} = 95$ h with PCDF dispersed as solid films (Buser 1988)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (4.9 - 6.0) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (1.4 - 8.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime $\tau = 1.9\text{--}11$ d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a tetra-chlorinated dibenzofuran at room temp. (Atkinson 1991)

$k_{OH}(\text{calc}) = (0.8 - 1.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated lifetime $\tau = 7.7\text{--}18$ d for a tetra-chlorinated dibenzofuran at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 142 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.007 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 171 \text{ L kg}^{-1} \text{ d}^{-1}$, $220 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for TCDF homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$, the tropospheric lifetime of a tetra-PCDF for the gas-phase reaction with OH radical was calculated to be 1.9–11 d (Atkinson 1991); calculated room temp. tropospheric lifetime of 7.7–18 d for tetrachloro-DCF_s for the gas-phase reaction with OH radical (Kwok et al. 1995).

Surface water:

Ground water:

Sediment: degradation $t_{1/2} = 20\text{--}200$ yr for all homologues (Suzuki et al. 2000)

Soil:

Biota: $t_{1/2} = 96$ d for PBO treated goldfish in 120-h exposure studies (Sijm et al. 1993).

9.1.1.13 1,2,7,8-Tetrachlorodibenzofuran

Common Name: 1,2,7,8-Tetrachlorodibenzofuran

Synonym:

Chemical Name: 1,2,7,8-tetrachlorodibenzofuran

CAS Registry No: 58802-20-3

Molecular Formula: $C_{12}H_4Cl_4O$, $C_6H_2Cl_2OC_6H_2Cl_2$

Molecular Weight: 305.978

Melting Point ($^{\circ}C$):

210–211 (Kuroki et al. 1984; Rordorf 1989)

Boiling Point ($^{\circ}C$):

438.3 (Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

260.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

81.5 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

120.604 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

36.6 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} (J/mol K):

76 (Rordorf 1989)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0496 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

0.0273; 0.0496 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.67×10^{-4} (estimated, Van den Berg et al. 1985)

1.30×10^{-4} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1989)

2.4×10^{-6} , 1.0×10^{-4} , 2.610^{-3} , 4.2×10^{-2} , 0.49 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1985a,b, 1987, 1989)

3.55×10^{-4} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

$\log(P_L/mmHg) = 35.97 - 6020/(T/K) - 8.399 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

1.047×10^{-4} , 3.35×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

2.09 (calculated-SOFA model, Govers & Krop 1998)

1.70; 2.09 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.23 (shake flask-slow stirring-GC/MS, from fly-ash extract, Sijm et al. 1989)

6.41 (calculated-SOFA model, Govers & Krop 1998)

5.964 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)

6.10; 6.41 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 4.97 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
 5.22; 4.97 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

- 7.20 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
 7.24; 7.20 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: sunlight induced photolysis $t_{1/2} = 220$ min in isooctane solution, and solid phase photolysis half-life, $t_{1/2} = 35$ h with PCDF dispersed as solid films (Buser 1988);

$k = 0.014 \text{ min}^{-1}$ with $t_{1/2} = 50$ min in pure water and $k = 0.0041 \text{ min}^{-1}$ with $t_{1/2} = 170$ min in 60 % acetonitrile/water solution in Corex centrifuge bottles at 300 nm photochemical reactor; $k = 0.08 \text{ h}^{-1}$ with $t_{1/2} = 8.3$ h in pure water in sunlight at 42°N latitude in middle of July (Kim & O'Keefe 2000)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (1.4\text{--}8.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for a tetra-chlorinated dibenzofuran, tropospheric lifetime was calculated to be 1.9–11 d using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ (Atkinson 1991)

$k_{OH}(\text{calc}) = (0.8\text{--}1.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and the calculated tropospheric lifetime was 7.7–18 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 162, 130 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.14, >1.0 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 171 \text{ L kg}^{-1} \text{ d}^{-1}$, $220 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $P_5\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$, the tropospheric lifetime of a tetra-PCDF for the gas-phase reaction with OH radical was calculated to be 1.9–11 d (Atkinson 1991); calculated room temp. tropospheric lifetime of 7.7–18 d for tetrachloro-DCFs for the gas-phase reaction with OH radical (Kwok et al. 1995).

Surface water:

Ground water:

Sediment: degradation $t_{1/2} = 20\text{--}200$ yr in sediment for all homologues (Suzuki et al. 2000)

Soil:

Biota: $t_{1/2} = 4.9$ d for PBO treated goldfish, and $t_{1/2} < 0.7$ d for control fish in 120-h exposure studies (Sijm et al. 1993).

9.1.1.14 1,3,6,8-Tetrachlorodibenzofuran

Common Name: 1,3,6,8-Tetrachlorodibenzofuran

Synonym:

Chemical Name: 1,3,6,8-tetrachlorodibenzofuran

CAS Registry No: 71998-72-6

Molecular Formula: $C_{12}H_4Cl_4O$, $C_6H_2Cl_2OC_6H_2Cl_2$

Molecular Weight: 305.978

Melting Point ($^{\circ}C$):

177–178 (Kuroki et al. 1984; Rordorf 1989)

Boiling Point ($^{\circ}C$):

438.3 (Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

260.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

83.8 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

122.36 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

36.6 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} (J/mol K):

81 (Rordorf 1989)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.212 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

0.0625; 0.212 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2002)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

3.6×10^{-6} , 1.6×10^{-4} , 4.3×10^{-3} , 7.4×10^{-2} , 0.88 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

1.17×10^{-3} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

$\log(P_L/mmHg) = 36.34 - 6020/(T/K) - 8.399 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

2.95×10^{-4} , 1.17×10^{-3} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

1.62 (calculated-SOFA model, Govers & Krop 1998)

2.04; 1.62 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.37 (shake flask/slow stirring-GC/MS, fly-ash extract, Sijm et al. 1989)

6.06 (calculated-SOFA model, Govers & Krop 1998)

5.92; 6.06 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, log BCF or log K_B :

- 5.0 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
5.23; 5.0 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, log K_{OC} :

- 6.71 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
6.76; 6.71 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (1.4-8.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for a tetra-chlorinated dibenzofuran, tropospheric lifetime was calculated to be 1.9–11 d using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ (Atkinson 1991)

$k_{OH}(\text{calc}) = (0.8-1.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and the calculated tropospheric lifetime was 7.7–18 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$, the tropospheric lifetime of a tetra-PCDF for the gas-phase reaction with OH radical was calculated to be 1.9–11 d (Atkinson 1991); calculated room temp. tropospheric lifetime of 7.7–18 d for tetrachloro-DCFs for the gas-phase reaction with OH radicals (Kwok et al. 1995).

Soil:

Biota:

9.1.1.15 1,3,7,8-Tetrachlorodibenzofuran

Common Name: 1,3,7,8-Tetrachlorodibenzofuran

Synonym: 1,3,7,8-TCDF

Chemical Name: 1,3,7,9-tetrachlorodibenzofuran

CAS Registry No: 57117-35-8

Molecular Formula: $C_{12}H_4Cl_4O$, $C_6H_2Cl_2OC_6H_2Cl_2$

Molecular Weight: 306

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

260.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.116 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

0.0463; 0.116 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and the reported temperature dependence equations):

6.03×10^{-4} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

2.00×10^{-4} , 6.03×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

3.51×10^{-5} (solid P_s , gas saturation-GC/MS, Mader & Pankow 2003)

$\log(P_L/mmHg) = 36.20 - 6020/(T/K) - 8.399 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

1.55 (calculated-SOFA model, Govers & Krop 1998)

1.91; 1.55 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.39 (shake flask/slow stirring-GC/MS, mixture of fly ash extract, Sijm et al. 1989)

6.20 (calculated-SOFA model, Govers & Krop 1998)

5.98; 6.20 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.83 (gold fish treated with metabolic inhibitor PBO, 120-h exposure, Sijm et al. 1993)

5.01 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)

5.23; 5.01 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

6.90 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

6.95; 6.90 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference: $k_{OH}(\text{calc}) = (4.9 - 6.0) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991) $k_{OH} = (1.4 - 8.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime $\tau = 1.9\text{--}11 \text{ d}$, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a tetra-chlorinated dibenzofuran at room temp. (Atkinson 1991) $k_{OH}(\text{calc}) = (0.8 - 1.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated lifetime $\tau = 7.7\text{--}18 \text{ d}$ for a tetra-chlorinated dibenzofuran at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2): $k_1 = 164, 293 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 < 0.1, > 1.4 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993) $k_1 = 171 \text{ L kg}^{-1} \text{ d}^{-1}$, $220 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for TCDF homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$, the tropospheric lifetime of a tetra-CDF for the gas-phase reaction with OH radical was calculated to be 1.9–11 d (Atkinson 1991); calculated room temp. tropospheric lifetime of 7.7–18 d for tetrachloro-DFs for the gas-phase reaction with OH radical (Kwok et al. 1995).

Surface water:

Ground water:

Sediment: degradation $t_{1/2} = 20\text{--}200 \text{ yr}$ for all homologues (Suzuki et al. 2000)

Soil:

Biota: $t_{1/2} > 7 \text{ d}$ for PBO treated goldfish and $t_{1/2} < 0.5 \text{ d}$ for control fish in 120-h exposure studies (Sijm et al. 1993).

9.1.1.16 1,3,7,9-Tetrachlorodibenzofuran

Common Name: 1,3,7,9-Tetrachlorodibenzofuran

Synonym: 1,3,7,9-TCDF

Chemical Name: 1,3,7,9-tetrachlorodibenzofuran

CAS Registry No: 64560-17-4

Molecular Formula: $C_{12}H_4Cl_4O$, $C_6H_2Cl_2OC_6H_2Cl_2$

Molecular Weight: 305.978

Melting Point ($^{\circ}C$):

206.5–207.5 (Kuroki et al. 1984; Rordorf 1989)

Boiling Point ($^{\circ}C$):

438.3 (calculated, Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

260.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

83.3 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

121.988 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

36.6 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} (J/mol K):

80 (Rordorf 1989)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.104 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

0.0422; 0.104 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.5×10^{-6} , 1.1×10^{-4} , 2.7×10^{-3} , 4.5×10^{-2} , 0.51 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

4.37×10^{-4} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

1.78×10^{-4} , 4.36×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

$\log(P_L/mmHg) = 36.15 - 6018/(T/K) - 8.399 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

1.26 (calculated-SOFA model, Govers & Krop 1998)

1.86; 1.26 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.39 (shake flask/slow stirring-GC/MS, Sijm et al. 1989)

6.22 (calculated-SOFA model, Govers & Krop 1998)

6.00; 6.22 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.83 (gold fish treated with metabolic inhibitor PBO, 120-h exposure, Sijm et al. 1993)

5.06 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)

5.23; 5.06 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

6.91 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

7.00; 6.91 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 8.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (1.4\text{--}8.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for a tetra-chlorinated dibenzofuran, tropospheric lifetime was calculated to be 1.9–11 d using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ (Atkinson 1991)

$k_{OH}(\text{calc}) = (0.8\text{--}1.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and the calculated tropospheric lifetime was 7.7–18 d at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 164, 293 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 < 0.1, > 1.4 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 171 \text{ L kg}^{-1} \text{ d}^{-1}, 220 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $P_5\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$, the tropospheric lifetime of a tetra-PCDF for the gas-phase reaction with OH radical was calculated to be 1.9–11 d (Atkinson 1991); calculated room temp. tropospheric lifetime of 7.7–18 d for tetrachloro-DCF_s for the gas-phase reaction with OH radical (Kwok et al. 1995).

Surface water:

Ground water:

Sediment: degradation $t_{1/2} = 20\text{--}200 \text{ yr}$ in sediment for all homologues (Suzuki et al. 2000)

Soil:

Biota: $t_{1/2} > 7 \text{ d}$ for PBO treated gold fish and $t_{1/2} < 0.5 \text{ d}$ for control fish in 120-h exposure studies (Sijm et al. 1993).

9.1.1.17 2,3,7,8-Tetrachlorodibenzofuran

Common Name: 2,3,7,8-Tetrachlorodibenzofuran

Synonym: 2,3,7,8-TCDF

Chemical Name: 2,3,7,8-Tetrachlorodibenzofuran

CAS Registry No: 51207-31-9

Molecular Formula: $C_{12}H_4Cl_4O$, $C_6H_2Cl_2OC_6H_2Cl_2$

Molecular Weight: 305.978

Melting Point ($^{\circ}C$):

227 (Lide 2003)

Boiling Point ($^{\circ}C$):

438.3 (calculated, Rordorf 1989)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

260.3 (calculated-Le Bas method at normal boiling point)

199.4 (Ruelle & Kesselring 1997; quoted, Passivirta et al. 1999)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

80.3 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

119.699 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

36.6 (Rordorf 1989; quoted, Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

73.2 (Rordorf 1989; quoted, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F:

0.0104 (calculated-assuming $\Delta S_{fus} = 56 J/mol K$ and $mp = 227^{\circ}C$)

0.00256 (calculated- ΔS_{fus} and mp , Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

4.19×10^{-4} ($22.7^{\circ}C$, generator column-HPLC/LSC, Friesen et al. 1990)

3.51×10^{-3} (calculated-QSAR, Fiedler & Schramm 1990)

4.20×10^{-4} ; 5.32×10^{-4} (quoted exptl., calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

0.0413; 0.0413 (supercooled liquid S_L , quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 0.655 - 1915/(T/K)$, (supercooled liquid, Passivirta et al. 1999)

0.0243; 0.0413 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.0×10^{-6} (quoted, Van den Berg & Olie 1985)

2.0×10^{-6} , 8.5×10^{-5} , 2.1×10^{-3} , 3.3×10^{-2} , 0.38 (25 , 50 , 75 , 100 , $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

1.23×10^{-4} (GC-RT correlation, supercooled liquid P_L , Eitzer & Hites 1988, 1991; quoted, Della Site 1997)

1.13×10^{-4} (GC-RT correlation, supercooled liquid P_L , Eitzer & Hites 1989; quoted, Della Site 1997)

2.00×10^{-4} (supercooled liquid P_L , Falconer & Bidleman 1994; quoted, Kaupp & McLachlan 1999)

1.23×10^{-6} , 1.13×10^{-6} (calculated from reported P_L , solid vapor pressures, Della Site 1997)

7.50×10^{-4} (corrected supercooled liquid P_L in Eitzer & Hites 1988, Eitzer & Hites 1998)

1.62×10^{-4} ; 3.72×10^{-4} (supercooled liquid P_L , quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

7.39×10^{-4} ; 1.89×10^{-6} (supercooled liquid P_L from GC-RT correlation; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 12.48 - 5425/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 8.66 - 3513/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

- 1.678×10^{-5} (solid P_s , gas saturation-GC/MS, Mader & Pankow 2003)
 1.718×10^{-3} (supercooled liquid P_L , calculated from P_s assuming $\Delta S_{fus} = 56$ J/mol K, Mader & Pankow 2003)
 $\log (P_L/\text{mmHg}) = 35.91 - 6019/(T/K) - 8.399 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)
 8.91×10^{-5} , 3.72×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

- 1.50 (calculated for tetrachloro-PCDFs, Eitzer & Hites 1989)
 1.70 (gas stripping-GC, 21°C , Friesen et al. 1993)
 1.17; 2.69 (quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 $\log [H/(\text{Pa m}^3/\text{mol})] = 8.01 - 1598/(T/K)$ (Passivirta et al. 1999)
 1.66; 2.69 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 5.82 (HPLC-RT correlation, Burkhard & Kuehl 1986)
 6.53 (shake flask/slow stirring-GC/MS, from mixture of fly ash extract, Sijm et al. 1989)
 6.19 (correlated, Ma et al. 1990)
 7.10 (calculated-QSAR, Fiedler & Schramm 1990)
 7.70 (calculated, Broman et al. 1991)
 5.83 (HPLC-RT correlation, Jackson et al. 1993)
 6.53 (recommended, Hansch et al. 1995)
 6.46 (calculated-SOFA model, Govers & Krop 1998)
 6.46, 6.58 (quoted, calculated-solubility $\log S_L$ and regression from lit. $\log K_{ow}$, Passivirta et al. 1999)
 6.225 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
 6.13; 6.46 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations:

- 9.42 (Finizio et al. 1997; quoted, Kaupp & McLachlan 1999)
 10.02; 9.44 (generator column-GC/ECD; calculated, Harner et al. 2000)
 10.90 (7°C , GC retention time correlation, Harner et al. 2000)
 $\log K_{OA} = -4.92 + 4450/(T/K)$; temp range $10\text{--}50^\circ\text{C}$ (Harner et al. 2000)

Bioconcentration Factor, $\log \text{BCF}$:

- 4.82 (guppy, Opperhuizen et al. 1986)
 3.78, 3.39 (rainbow trout, exposed to: 0.41 ng/L, 3.93 ng/L for 28 d, Mehrle et al. 1988)
 3.64, 3.41 (rainbow trout, quoted, Opperhuizen & Sijm 1990)
 3.82 (guppy, quoted, Opperhuizen & Sijm 1990)
 4.19; 4.12 (guppies, 21-d exposure, lipid wt: system I - absence of sediment; system II - with presence of sediment, Loonen et al. 1994a)
 4.19; 4.33; 5.02 (guppies, 21-d exposure, lipid wt basis: measured- C_{fish}/C_w ; calculated; rate constant ratio k_1/k_2 from non-linear regression analysis, Loonen et al. 1994b)
 4.93 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
 5.23, 6.53 (fish with 5% lipid: wet weight basis, lipid weight basis, Geyer et al. 2000)
 6.54, 5.75 (fish muscle $\log \text{BCF}_L$ calculated from water, sediment, Wu et al. 2001)
 5.22; 4.93 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{oc}$:

- 5.20 (organic carbon, calculated-QSAR, Fiedler & Schramm 1990)
 7.50 (calculated, Broman et al. 1991)
 6.62 (calculated- K_{ow} , Kollig 1993)
 5.18; 5.34 (sediment in lake mesocosm, Muir et al. 1992)
 7.08; 7.29 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
 7.32; 7.29 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: sunlight induced photolysis $t_{1/2} = 220$ min in isooctane solution, and solid phase $t_{1/2} = 120$ h with PCDF dispersed as solid films (Buser 1988);

photolytic $t_{1/2} = 9.8$ h in extract of fly-ash and in tetradecane solution for native congener and $t_{1/2} = 3.0$ h for ^{13}C -labelled congener (Tysklind & Rappe 1991).

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}}(\text{calc}) = 2.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1987b)

$k_{\text{O}_3} = 1.32 \times 10^5 \text{ L g}^{-1} \text{ min}^{-1}$ oxidative degradation rate constant for water dissolved PCDF by ozone under alkaline conditions at pH 10 and 20°C (Palauscek & Scholz 1987);

$k_{\text{OH}}(\text{calc}) = (2.4 - 3.5) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{\text{OH}} = (1.4 - 8.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime $\tau = 1.9\text{--}11$ d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a tetra-chlorinated dibenzofuran at room temp. (Atkinson 1991)

$k_{\text{OH}}(\text{calc}) = (0.8 - 1.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated lifetime $\tau = 7.7\text{--}18$ d for a tetra-chlorinated dibenzofuran at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 400 \text{ d}^{-1}$; $k_2 = 0.062 \text{ d}^{-1}$ (guppy, exposed to fly-ash extract, Opperhuizen et al. 1986)

$k_1 = 1228, 6853 \text{ d}^{-1}$; $k_2 = 0.28, 2.60 \text{ d}^{-1}$ (rainbow trout, exposed to: 0.41 ng/L, 3.93 ng/L for 28 d, Mehrle et al. 1988)

$k_1 = 56, 453 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 < 0.1, 0.22 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 171 \text{ L kg}^{-1} \text{ d}^{-1}, 220 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for P_3CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_2 = 0.0058 \text{ d}^{-1}$ with a biological $t_{1/2} = 58$ d (blue mussel, 99-d exposure, Hektoen et al. 1994)

$k_1 = 603 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.292 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994a)

$k_2 = 0.0263 \text{ d}^{-1}$ with $t_{1/2} = 26$ d (newly contaminated oysters, Gardinali et al. 2004)

$k_2 = 0.0194 \text{ d}^{-1}$ with $t_{1/2} = 36$ d (chronically contaminated oysters, Gardinali et al. 2004)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$, the tropospheric lifetime of a tetra-PCDF for the gas-phase reaction with OH radical was calculated to be 1.9–11 d (Atkinson 1991); calculated room temp. tropospheric lifetime to be 7.7–18 d for the gas-phase reaction with OH radical (Kwok et al. 1995);

$t_{1/2} = 320$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: $t_{1/2} = 90$ min in isooctane solution in summer sunlight (Palauscek & Scholz 1987);

suggested $t_{1/2} = 6400$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: $t_{1/2} = 61$ yr (Geyer et al. 2000)

degradation $t_{1/2} = 20\text{--}200$ yr in sediment for all homologues (Suzuki et al. 2000)

$t_{1/2} = 550\,000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: degradation $t_{1/2} = 5\text{--}50$ yr in soil (Suzuki et al. 2000)

$t_{1/2} = 550\,000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: Elimination $t_{1/2} = 2$ d from rat (Birnbaum et al. 1980; quoted, Birnbaum 1985);

$t_{1/2} = 8$ d from monkey (Birnbaum et al. 1981; quoted, Birnbaum 1985);

$t_{1/2} = 2\text{--}4$ d from mouse (Decad et al. 1981b; quoted, Birnbaum 1985);

$t_{1/2} = 40$ d from guinea pig (Decad et al. 1981a; Ioannou et al. 1983; quoted, Birnbaum 1985);

elimination half-lives: in guinea pigs, 20 d; rats, < 2 d; monkeys, 8 d; and mice, 2–4 d (quoted,

Van den Berg & Olie 1985);

$t_{1/2} < 336$ d in carp (Kuehl et al. 1987);

elimination $t_{1/2} = 3.0$ d, 0.27 d (rainbow trout, exposed to 0.41 ng/L, 3.93 ng/L for 28 d, Mehrle et al. 1988);

elimination $t_{1/2} = 0.8$ d for lactating cows (Olling et al. 1991);

$t_{1/2} > 7$ d for PBO treated goldfish, $t_{1/2} = 3.1$ d for control fish in 120-h exposure studies (Sijm et al. 1993)

elimination $t_{1/2} = 111$ d from soft-shell clam (Brown 1994).

biological $t_{1/2} = 58$ d in blue mussel, 99-d exposure experiment (Hektoen et al. 1994)

Depuration $t_{1/2} = 26$ d for newly contaminated oysters, and $t_{1/2} = 36$ d for chronically contaminated oysters (Gardinali et al. 2004)

9.1.1.18 1,2,3,4,7-Pentachlorodibenzofuran

Common Name: 1,2,3,4,7-Pentachlorodibenzofuran

Synonym: 1,2,3,4,7-PCDF

Chemical Name: 1,2,3,4,7-pentachlorodibenzofuron

CAS Registry No: 83704-48-7

Molecular Formula: $C_{12}H_3Cl_5O$, $C_6Cl_4OC_6H_3Cl$

Molecular Weight: 340.418

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

281.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0179 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

0.00745; 0.0179 (GC-RT correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.43×10^{-5} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1989)

2.09×10^{-5} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

$\log(P_L/mmHg) = 34.22 - 6088/(T/K) - 7.865 \cdot \log(T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

1.905×10^{-5} , 1.202×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$):

2.24 (calculated-SOFA model, Govers & Krop 1998)

1.35; 2.24 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.53 (shake flask/slow stirring-GC/MS, mixture of fly-ash extract, Sijm et al. 1989)

6.89 (calculated-SOFA model, Govers & Krop 1998)

6.45; 6.89 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

4.80 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)

5.13; 4.80 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

7.89 (sediment/water, calculated-SOFA model, Govers & Krop 1998)

8.06; 7.89 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference: $k_{OH}(\text{calc}) = (3.6 - 4.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991) $k_{OH} = (1.0 - 4.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime $\tau = 3.6\text{--}15 \text{ d}$, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a penta-chlorinated dibenzofuran at room temp. (Atkinson 1991) $k_{OH}(\text{calc}) = (0.5 - 1.0) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated lifetime $\tau = 15\text{--}29 \text{ d}$ for a penta-chlorinated dibenzofuran at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2): $k_1 = 68 \text{ L kg}^{-1} \text{ d}^{-1}$ (goldfish after 120-h exposure: control fish, Sijm et al. 1993) $k_1 = 110 \text{ L kg}^{-1} \text{ d}^{-1}$, $174 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $P_5\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993) $k_2 > 0.5$, $< 1.7 \text{ d}^{-1}$ (goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$, the tropospheric lifetime of a penta-PCDF for the gas-phase reaction with OH radical was calculated to be 3.6–15 d (Atkinson 1991)
calculated tropospheric lifetime to be 15–29 d for the gas-phase reaction with OH radical (Kwok et al. 1995)

Surface water:

Ground water:

Sediment:

Soil:

Biota: $t_{1/2} < 1.4 \text{ d}$ for PBO treated goldfish and $t_{1/2} < 0.4 \text{ d}$ for control fish in 120-h exposure studies (Sijm et al. 1993).

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

128.978 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

42.4 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} (J/mol K):

85 (Rordorf 1989)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0108 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 0.794 - 2223/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

0.0679; 0.0108 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

3.27×10^{-5} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1989)

2.3×10^{-7} , 1.5×10^{-5} , 4.0×10^{-4} , 8.0×10^{-3} , 0.11 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

6.17×10^{-5} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

2.40×10^{-4} ; 2.35×10^{-7} (supercooled liquid P_L from GC-RT correlation; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 12.67 - 5750/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 8.23 - 3529/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

1.084×10^{-6} (solid P_s , gas saturation-GC/MS, Mader & Pankow 2003)

1.084×10^{-4} (supercooled liquid P_L , calculated from P_s assuming $\Delta S_{fus} = 56$ J/mol K, Mader & Pankow 2003)

$\log (P_L/mmHg) = 34.15 - 6081/(T/K) - 7.865 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

1.70×10^{-3} , 6.17×10^{-5} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ or as indicated and reported temperature dependence equations):

1.91 (calculated-SOFA model, Govers & Krop 1998)

$\log (H/(Pa \cdot m^3/mol)) = 7.44 - 1306/(T/K)$ (Passivirta et al. 1999)

1.35; 1.91 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 6.79 (shake flask/slow stirring-GC/MS, Sijm et al. 1989)
 6.99 (calculated-SOFA model, Govers & Krop 1998)
 7.07 (estimated-solubility S_L and regression eq. using lit. K_{OW} values, Passivirta et al. 1999)
 6.47; 6.99 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 11.4 (7°C, GC retention time correlation, Harner et al. 2000)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 3.38 (guppy, Opperhuizen et al. 1986)
 3.84, 3.61 (gold fish: treated with metabolic inhibitor PBO, control fish, 120-h exposure, Sijm et al. 1993)
 4.84 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
 5.12; 4.84 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

- 7.60 (Baltic Sea particulate field samples, concn distribution-GC/MS, Broman et al. 1991)
 8.03 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
 8.11; 8.03 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photolytic half-life in extract of fly-ash and in tetradecane solution, $t_{1/2} = 10.0$ h for native congener (Tysklind & Rappe 1991)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 2.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (1.0 - 4.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime of 3.6–15 d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ for a penta-chlorinated dibenzofuran at room temp. (Atkinson 1991)

$k_{OH}(\text{calc}) = (0.5 - 1.0) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated lifetime of 15–29 d for a penta-chlorinated dibenzofuran at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 98, 252 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 < 0.1, < 0.1 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 110 \text{ L kg}^{-1} \text{ d}^{-1}, 174 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for P_5 CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_2 = 0.0126 \text{ d}^{-1}$ with a biological $t_{1/2} = 24$ d (blue mussel, 99-d exposure, Hektoen et al. 1994)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$, the tropospheric lifetime of a penta-PCDF for the gas-phase reaction with OH radical was calculated to be 3.6–15 d (Atkinson 1991); calculated room temp. tropospheric lifetime to be 15–29 d for the gas-phase reaction with OH radical (Kwok et al. 1995);

suggested $t_{1/2} = 660$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Surface water: $t_{1/2} = 13200$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Ground water:

Sediment: $t_{1/2} = 450000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: $t_{1/2} = 450000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Biota: elimination $t_{1/2} = 3.3$ –3.5 d in the liver of female Sprague Dawley rats (Van den Berg et al. 1989);

$t_{1/2} > 7$ d for PBO treated goldfish and $t_{1/2} > 7$ d for control fish in 120-h exposure studies (Sijm et al. 1993)

biological $t_{1/2} = 24$ d in blue mussel, 99-d exposure experiment (Hektoen et al. 1994)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: $t_{1/2} = 48.5$ d on spruce needle surfaces under sunlight irradiation (Niu et al. 2003)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (1.8 - 1.8) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (1.0 - 4.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime of 3.6–15 d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ for a penta-chlorinated dibenzofuran at room temp. (Atkinson 1991)

$k_{OH}(\text{calc}) = (0.5 - 1.0) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated lifetime of 15–29 d for a penta-chlorinated dibenzofuran at room temp. (Kwok et al. 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 63, 77 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 < 0.1, > 1.3 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 110 \text{ L kg}^{-1} \text{ d}^{-1}, 174 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for P_5 CDF homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$, the tropospheric lifetime of a penta-PCDF for the gas-phase reaction with OH radical was calculated to be 3.6–15 d (Atkinson 1991); calculated tropospheric lifetime $\tau = 15\text{--}29$ d for the gas-phase reaction with OH radical at room temp. (Kwok et al. 1995);

suggested $t_{1/2} = 660$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Surface water: suggested $t_{1/2} = 13200$ h at 7°C in Baltic Proper environment (Sinkkonen & Passivirta 2000)

Ground water:

Sediment: suggested $t_{1/2} = 450000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: suggested $t_{1/2} = 450000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Biota: elimination $t_{1/2} = 3.3\text{--}3.5$ d in the liver of female Sprague Dawley rats (Van den Berg et al. 1989);

$t_{1/2} > 7$ d for metabolic inhibitor PBO treated gold fish and $t_{1/2} < 1.5$ d for control fish in 120-h exposure studies (Sijm et al. 1993).

9.1.1.21 2,3,4,7,8-Pentachlorodibenzofuran

Common Name: 2,3,4,7,8-Pentachlorodibenzofuran

Synonym: 2,3,4,7,8-PCDF

Chemical Name: 2,3,4,7,8-pentachlorodibenzofuran

CAS Registry No: 57117-31-4

Molecular Formula: $C_{12}H_3Cl_5O$, $C_6H_2Cl_2OC_6HCl_3$

Molecular Weight: 340.418

Melting Point ($^{\circ}C$):

196–196.5 (Kuroki et al. 1984, Rordorf 1989)

Boiling Point ($^{\circ}C$):

464.7 (calculated, Rordorf 1989)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

281.2 (calculated-Le Bas method at normal boiling point)

212.3 (Ruelle & Kesselring 1997; quoted, Passivirta et al. 1999)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

85.6 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

130.43 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

42.4 (Rordorf 1989; quoted, Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

90 (Rordorf 1989; quoted, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F:

0.0208 (calculated-assuming $\Delta S_{fus} = 56\ J/mol\ K$ and $mp = 196.5^{\circ}C$)

0.00196 (calculated- ΔS_{fus} and mp , Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.000515 (calculated-QSAR, Fiedler & Schramm 1990)

0.000236 ($22.7^{\circ}C$, generator column-GC/MS, Friesen et al. 1990)

0.00015 (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

0.0115; 7.11×10^{-3} (supercooled liquid S_L , quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 1.076 - 2218/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

0.00481; 0.00711 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.17×10^{-5} (supercooled liquid P_L -GC-RT correlation, Eitzer & Hites 1988, 1991)

2.43×10^{-5} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1989)

3.5×10^{-7} , 2.1×10^{-5} , 6.7×10^{-4} , 1.4×10^{-2} , 0.19 (25 , 50 , 75 , 100 , $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

1.74×10^{-5} (supercooled liquid P_L , Falconer & Bidleman 1994; quoted, Kaupp & McLachlan 1999)

1.53×10^{-4} (corrected supercooled liquid P_L in Eitzer & Hites 1988, Eitzer & Hites 1998)

1.95×10^{-5} ; 5.50×10^{-5} (supercooled liquid P_L , quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

1.91×10^{-4} ; 3.74×10^{-7} (supercooled liquid P_L from GC-RT correlation; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 12.62 - 5677/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 7.90 - 3462/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

- 6.53×10^{-6} (solid P_s , gas saturation-GC/MS, Mader & Pankow 2003)
 3.20×10^{-4} (supercooled liquid P_L , calculated from P_s assuming $\Delta S_{fus} = 56$ J/mol K, Mader & Pankow 2003)
 $\log (P_L/\text{mmHg}) = 33.99 - 6084/(T/K) - 7.865 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)
 1.15×10^{-5} , 5.50×10^{-5} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ or as indicated and reported temperature dependence equations):

- 0.505 (calculated-P/C with selected values)
 0.575; 2.57 (quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 $\log (H/(\text{Pa m}^3/\text{mol})) = 6.82 - 1244/(T/K)$ (Passivirta et al. 1999)
 1.29; 2.57 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

- 6.92 (shake flask/slow stirring-GC/MS, from fly-ash extract, Sijm et al. 1989)
 7.82 (calculated-QSAR, Fiedler & Schramm 1990)
 7.60 (calculated, Broman et al. 1991)
 6.92 (recommended, Hansch et al. 1995)
 7.11 (calculated-SOFA model, Govers & Krop 1998)
 7.11, 6.90 (quoted, calculated-solubility $\log S_L$ and regression from lit. $\log K_{ow}$, Passivirta et al. 1999)
 6.757 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
 6.56; 7.11 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 10.09 (Finizio et al. 1997; quoted, Kaupp & McLachlan 1999)
 11.52 (7°C, GC-retention time correlation, Harner et al. 2000)

Bioconcentration Factor, $\log BCF$:

- 3.70 (guppy, Opperhuizen et al. 1986; quoted, Opperhuizen & Sijm 1990)
 5.14; 4.92 (guppies, 21-d exposure, lipid wt: system I - absence of sediment; system II - with presence of sediment, Loonen et al. 1994a)
 5.14; 5.15; 5.38 (guppies, 21-d exposure, lipid weight basis: measured- C_{fish}/C_w ; calculated; rate constant ratio k_1/k_2 from non-linear regression analysis, Loonen et al. 1994b)
 5.14; 4.79 (lipid wt basis, quoted exptl.; quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 5.62; 5.92, 6.92 (fish 5% lipid: wet wt basis; fish 10% lipid: wet wt basis, lipid wt basis, Geyer et al. 2000)
 6.42, 5.88 (fish muscle $\log BCF_L$ calculated from water, sediment, Wu et al. 2001)
 5.08; 4.79 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Bioaccumulation Factor, BAF:

- 1.44, 1.33 (rainbow trout, concn in food: 0.82, 9.01 ng/g, Muir et al. 1990)

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.59 (organic carbon, calculated-QSAR, Fiedler & Schramm 1990)
 7.40 (calculated, Broman et al. 1991)
 6.60, 6.92 (calculated- K_{ow} , Kollig 1993)
 8.20 (calculated-SOFA model, sediment/water, Govers & Krop 1998)
 8.30; 8.20 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

- Photolysis: photolytic degradation $t_{1/2} = 3.5$ h of PCDD in extract of fly-ash in tetradecane solution for native congener and $t_{1/2} = 3.1$ h for ^{13}C -labelled congener (Tysklind & Rappe 1991)
 $t_{1/2} = 55.0$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003)

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (1.7 - 1.8) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (1.0 - 4.3) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime $\tau = 3.6\text{--}15 \text{ d}$, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ for a penta-chlorinated dibenzofuran at room temp. (Atkinson 1991)

$k_{OH}(\text{calc}) = (0.5 - 1.0) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated lifetime $\tau = 15\text{--}29 \text{ d}$ for a penta-chlorinated dibenzofuran at room temp. (Kwok et al. 1995)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.0027 \text{ d}^{-1}$ (carp, calculated from data reported by Kuehl et al. 1987, Sijm et al. 1990)

$k_1 = 400 \text{ mL g}^{-1} \text{ d}^{-1}$; $k_2 = 0.079 \text{ d}^{-1}$ (guppy, Opperhuizen et al. 1986)

$k_2 = 0.0064 \text{ d}^{-1}$ (liver of female rat, Van den Berg et al. 1989)

$k_2 = -2.1 \times 10^{-2}$, $1.5 \times 10^{-2} \text{ d}^{-1}$ (rainbow trout, 2 to 21 d exposure: metabolic inhibitor PBO-treated, control, Sijm et al. 1990)

$k_2 = 10.1 \times 10^{-3} \text{ d}^{-1}$ and $k_2 = 8.10 \times 10^{-3} \text{ d}^{-1}$; $k_2 = 12.6 \times 10^{-3} \text{ d}^{-1}$ and $k_2 = 11.4 \times 10^{-3} \text{ d}^{-1}$ (rainbow trout, 0–140 d and 0–180 d exposure at 0.82 ng/g PCDF concn.; 0–140 d and 0–180 d exposure at 9.01 ng/g PCDF concn., Muir et al. 1990)

$k_1 = 105$, $561 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.11$, $< 0.1 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 110 \text{ L kg}^{-1} \text{ d}^{-1}$, $174 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $P_5\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_2 = 0.0081 \text{ d}^{-1}$ with a biological $t_{1/2} = 36 \text{ d}$ (blue mussel, 99-d exposure, Hektoen et al. 1994)

$k_1 = 1012 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.044 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

Half-Lives in the Environment:

Air: using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$, the tropospheric lifetime of a penta-PCDF for the gas-phase reaction with OH radical was calculated to be 3.6–15 d (Atkinson 1991); calculated room temp. tropospheric lifetime to be 15–29 d for the gas-phase reaction with OH radical (Kwok et al. 1995);

$t_{1/2} = 660 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: photolytic $t_{1/2} = 3.5 \text{ h}$ in the extract from fly-ash in tetradecane solution, for native congener and $t_{1/2} = 3.1 \text{ h}$ for ^{13}C labelled congener (Tysklind & Rappe 1991)

$t_{1/2} = 13200 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: very persistent $t_{1/2} = 60 \text{ yr}$ (Geyer et al. 2000)

degradation $t_{1/2} = 20\text{--}200 \text{ yr}$ in sediment for all homologues (estimated, Suzuki et al. 2000);

$t_{1/2} = 550\,000 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: degradation $t_{1/2} = 5\text{--}50 \text{ yr}$ (estimated, Suzuki et al. 2000);

$t_{1/2} = 550\,000 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: elimination $t_{1/2} = 108 \text{ d}$ in the liver of female rats (Van den Berg et al. 1989);

$t_{1/2} = 69 \text{ d}$ in rainbow trout at the 0.82 ng/g exposure concentration from 0–140 d data, $t_{1/2} = 61 \text{ d}$ at 9.0 ng/g exposure concentration from 0–180 d data; $t_{1/2} = 65 \text{ d}$ in whole body rainbow trout with 31-d dietary exposure (Muir et al. 1990);

elimination $t_{1/2} = 48.5 \text{ d}$ for lactating cows (Olling et al. 1991);

$t_{1/2} = 6.1 \text{ d}$ for PBO treated goldfish and $t_{1/2} > 7 \text{ d}$ for control fish in 120-h exposure studies (Sijm et al. 1993)

biological $t_{1/2} = 49 \text{ d}$ in blue mussel, 99-d exposure experiment (Hektoen et al. 1994)

9.1.1.22 1,2,3,4,6,8-Hexachlorodibenzofuran

Common Name: 1,2,3,4,6,8-Hexachlorodibenzofuran

Synonym: 1,2,3,4,6,8-HxCDF

Chemical Name: 1,2,3,4,6,8-Hexachlorodibenzofuran

CAS Registry No: 69698-60-8

Molecular Formula: $C_{12}H_2Cl_6O$, $C_6H_2Cl_2OC_6Cl_4$

Molecular Weight: 374.863

Melting Point ($^{\circ}C$):

233.5–234 (Kuroki et al. 1984; Rordorf 1989)

Boiling Point ($^{\circ}C$):

487.7 (calculated, Rordorf 1989)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

302.1 (calculated-Le Bas method at normal boiling point)

225.2 (Ruelle & Kesselring 1997; quoted, Passivirta et al. 1999)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

86 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

137.049 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

48.1 (Rordorf 1989; quod, Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

95 (Rordorf 1989; quoted, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F :

0.000332 (calculated- ΔS_{fus} and mp, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

6.08×10^{-3} (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 0.839 - 2520/(T/K)$, (supercooled liquid, Passivirta et al. 1999)

2.48×10^{-3} , 5.08×10^{-3} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.9×10^{-8} , 2.1×10^{-6} , 8.1×10^{-5} , 1.9×10^{-3} , 0.031 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

7.67×10^{-6} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1989)

1.74×10^{-5} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

9.39×10^{-5} ; 4.53×10^{-8} (supercooled liquid P_L from GC-RT correlation; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 12.84 - 6057/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 7.88 - 3540/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

5.13×10^{-6} , 1.74×10^{-5} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

$\log (P_L/mmHg) = 32.06 - 6015/(T/K) - 7.332 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

1.023 (calculated-SOFA model, Govers & Krop 1998)

$\log (H/(Pa \cdot m^3/mol)) = 7.04 - 1020/(T/K)$ (Passivirta et al. 1999)

1.26; 1.012 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 7.31 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
 7.58 (calculated-solubility $\log S_L$ and regression from lit. $\log K_{OW}$ s, Passivirta et al. 1999)
 6.78; 7.31 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:Bioconcentration Factor, $\log BCF$:

- 4.66 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
 4.96; 4.66 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

- 8.47 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
 8.72; 8.47 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: $t_{1/2} = 59.8$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003)

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 0.74 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (0.7 - 2.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime of 5.9–22 d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a hexa-chlorinated dibenzofuran at room temp. (Atkinson 1991)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 168 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 < 0.1 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 110 \text{ L kg}^{-1} \text{ d}^{-1}$, $174 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $H_6\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated based on the gas-phase reaction rate constant for a hexa-chlorinated PCDF with OH radicals to be 5.9–22 d (Atkinson 1991);

suggested $t_{1/2} = 1400$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: suggested $t_{1/2} = 28\,000$ h at 7°C in Baltic Proper environment (Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200$ yr for all homologues (estimated, Suzuki et al. 2000);

suggested $t_{1/2} = 450\,000$ h at 7°C in Baltic Proper environment (Sinkkonen & Passivirta 2000).

Soil: degradation $t_{1/2} = 5\text{--}50$ yr (estimated, Suzuki et al. 2000);

suggested $t_{1/2} = 450\,000$ h at 7°C in Baltic Proper environment (Sinkkonen & Passivirta 2000).

Biota: $t_{1/2} > 7$ d for PBO treated goldfish in 120-h exposure studies (Sijm et al. 1993)

9.1.1.23 1,2,3,4,7,8-Hexachlorodibenzofuran

Common Name: 1,2,3,4,7,8-Hexachlorodibenzofuran

Synonym: 1,2,3,4,7,8-HxCDF

Chemical Name: 1,2,3,4,7,8-Hexachlorodibenzofuran

CAS Registry No: 70658-26-9

Molecular Formula: $C_{12}H_2Cl_6O$, $C_6H_2Cl_2OC_6Cl_4$

Molecular Weight: 374.863

Melting Point ($^{\circ}C$):

225.5–226.5 (Kuroki et al. 1984; Rordorf 1989)

Boiling Point ($^{\circ}C$):

487.7 (calculated, Rordorf 1989)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

302.1 (calculated-Le Bas method at normal boiling point)

225.2 (Ruelle & Kesselring 1997; quoted, Passivirta et al. 1999)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

86.5 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

137.397 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

48.1 (Rordorf 1989; quod, Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

96 (Rordorf 1989; quoted, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F :

0.0107 (calculated-assuming $\Delta S_{fus} = 56\ J/mol\ K$ and $mp = 226^{\circ}C$)

0.000402 (calculated- ΔS_{fus} and mp , Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

8.25×10^{-6} ($22.7^{\circ}C$, generator column-GC/MS, Friesen et al. 1990)

7.30×10^{-6} (computed-expert system SPARC, Kollig 1995)

8.2×10^{-6} , 1.13×10^{-6} (quoted exptl., calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

8.01×10^{-4} ; 2.65×10^{-3} (supercooled liquid S_L , quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 0.913 - 2516/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

1.64×10^{-3} , 2.65×10^{-3} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

8.093×10^{-6} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1988; quoted, Della Site 1997)

3.2×10^{-8} , 2.4×10^{-6} , 9.3×10^{-5} , 2.2×10^{-3} , 0.036 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

7.85×10^{-6} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1989; quoted, Della Site 1997)

8.90×10^{-8} (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)

3.09×10^{-6} (supercooled liquid P_L , Falconer & Bidleman 1994;)

8.67×10^{-8} (computed-expert system SPARC, Kollig 1995)

8.41×10^{-8} , 3.68×10^{-8} (P_s solid vapor pressure calculated from reported P_L , Della Site 1997)

6.05×10^{-5} (corrected supercooled liquid P_L in Eitzer & Hites 1988, Eitzer & Hites 1998)
 5.62×10^{-6} ; 1.38×10^{-5} (supercooled liquid P_L , quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 2.87×10^{-8} ; 7.13×10^{-5} (supercooled liquid P_L from GC-RT correlation; converted to solid P_s with fugacity ratio F , Passivirta et al. 1999)
 $\log (P_s/Pa) = 12.85 - 6077/(T/K)$ (solid, Passivirta et al. 1999)
 $\log (P_L/Pa) = 7.81 - 3564/(T/K)$ (supercooled liquid, Passivirta et al. 1999)
 $\log (P_L/\text{mmHg}) = 32.14 - 6106/(T/K) - 7.332 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)
 3.24×10^{-6} , 1.38×10^{-5} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence equations):

1.454 (calculated-P/C with selected values)
 4.26 (computed-expert system SPARC, Kollig 1995)
 2.63; 1.91 (quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 $\log [H/(\text{Pa m}^3/\text{mol})] = 6.90 - 1048/(T/K)$ (Passivirta et al. 1999)
 1.26; 1.905 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

7.70 (calculated, Broman et al. 1991)
 7.86 (computed-expert system SPARC, Kollig 1995)
 7.53 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
 7.54 (calculated-solubility $\log S_L$ and regression from lit. $\log K_{ow}$, Passivirta et al. 1999)
 7.184 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
 6.92; 7.53 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

10.64 (Finizio et al. 1997; quoted, Kaupp & McLachlan 1999)
 11.98 (7°C , GC-retention time correlation, Harner et al. 2000)

Bioconcentration Factor, $\log BCF$:

4.91; 4.40 (guppies, 21-d exposure, lipid wt: system I - absence of sediment; system II - with presence of sediment, Loonen et al. 1994a)
 4.91; 4.99; 5.04 (guppies, 21-d exposure, lipid weight basis: measured- C_{fish}/C_w ; calculated; rate constant ratio k_1/k_2 from non-linear regression analysis, Loonen et al. 1994b)
 4.57 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
 5.90, 5.26 (fish muscle $\log BCF_L$ calculated from water, sediment, Wu et al. 2001)
 4.88; 4.57 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

7.40 (calculated, Broman et al. 1991)
 7.54 (computed-expert system SPARC, Kollig 1995)
 8.83; 8.80 (sediment/water, quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 8.95; 8.80 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photolytic $t_{1/2} = 5.5$ h of the PCDD in extract of fly ash in tetradecane solution for native congener (Tysklind & Rappe 1991).

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{O_3}(\text{aq.}) = 7.28 \times 10^4 \text{ L} \cdot \text{g}^{-1} \cdot \text{min}^{-1}$, oxidative degradation rate constant of water dissolved PDCF by ozone under alkaline conditions at pH 10 and 20°C (Palaushek & Scholz 1987)

$k_{\text{OH}} = (0.7\text{--}2.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for a hexa-chlorinated dibenzofuran, tropospheric lifetime was calculated to be 5.9–22 d using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule cm}^{-3}$ (Atkinson 1991)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 100, 439 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.31, < 0.1 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 110 \text{ L kg}^{-1} \text{ d}^{-1}$, $174 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for P₅CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_2 = 0.0126 \text{ d}^{-1}$ with a biological $t_{1/2} = 24 \text{ d}$ (blue mussel, 99-d exposure, Hektoen et al. 1994)

$k_1 = 879 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.087 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated based on the gas-phase reaction rate constant for a hexa-chlorinated PCDF with OH radicals to be 5.9–22 d (Atkinson 1991);

$t_{1/2} = 1400 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: $t_{1/2} = 28\,000 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200 \text{ yr}$ for all homologues (estimated, Suzuki et al. 2000);

$t_{1/2} = 600\,000 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: degradation $t_{1/2} = 5\text{--}50 \text{ yr}$ (estimated, Suzuki et al. 2000);

$t_{1/2} = 600\,000 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: $t_{1/2} \sim 336 \text{ d}$ in carp (Kuehl et al. 1987);

elimination $t_{1/2} = 48.5 \text{ d}$ from lactating cows (Olling et al. 1991);

$t_{1/2} = 2.2 \text{ d}$ for PBO treated goldfish and $t_{1/2} > 7 \text{ d}$ for control fish in 120-h exposure studies (Sijm et al. 1993)

biological $t_{1/2} = 24 \text{ d}$ in blue mussel, 99-d exposure experiment (Hektoen et al. 1994)

9.1.1.24 1,2,3,6,7,8-Hexachlorodibenzofuran

Common Name: 1,2,3,6,7,8-Hexachlorodibenzofuran

Synonym:

Chemical Name: 1,2,3,6,7,8-hexachlorodibenzofuran

CAS Registry No: 57117-44-9

Molecular Formula: $C_{12}H_2Cl_6O$, $C_6HCl_3OC_6HCl_3$

Molecular Weight: 374.863

Melting Point ($^{\circ}C$):

232–234 (Rordorf 1989)

Boiling Point ($^{\circ}C$):

487.7 (calculated, Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

302.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

86.1 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

137.083 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

48.1 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} (J/mol K):

95 (Rordorf 1989)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.000358 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.00226 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 0.125 - 2515/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

1.56×10^{-3} , 2.26×10^{-3} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

7.33×10^{-6} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1989)

2.9×10^{-8} , 2.1×10^{-6} , 8.2×10^{-5} , 2.0×10^{-3} , 0.031 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1985a,b, 1987, 1989)

1.20×10^{-5} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

6.91×10^{-5} ; 2.47×10^{-8} (supercooled liquid P_L from GC-RT correlation; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 12.87 - 6101/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 7.91 - 3954/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

$\log (P_L/mmHg) = 32.12 - 6108/(T/K) - 7.332 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

3.09×10^{-6} , 1.20×10^{-5} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

1.91 (calculated-SOFA model, Govers & Krop 1998)

$\log (H/(Pa \cdot m^3/mol)) = 7.79 - 1439/(T/K)$, (Passivirta et al. 1999)

1.26; 1.91 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 7.60 (calculated, Broman et al. 1991)
 7.57 (calculated-SOFA model, Govers & Krop 1998)
 7.96 (estimated-solubility S_L and regression eq. using lit. K_{OW} values, Passivirta et al. 1999)
 7.196 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
 6.93; 7.57 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

- 12.0 (7°C, GC-retention time correlation, Harner et al. 2000)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 4.95; 4.49 (guppies, 21-d exposure, lipid wt: system I - absence of sediment; system II - with presence of sediment, Loonen et al. 1994a)
 4.95, 5.15; 5.24 (guppies, 21-d exposure, lipid weight basis: measured- C_{fish}/C_W ; calculated; rate constant ratio k_1/k_2 from non-linear regression analysis, Loonen et al. 1994b)
 4.58 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
 5.51 (fish muscle $\log BCF_L$ calculated from water, Wu et al. 2001)
 4.87; 4.58 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

- 7.40 (Baltic Sea particulate field samples, concn distribution-GC/MS, Broman et al. 1991)
 8.85 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
 8.97; 8.85 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photolytic $t_{1/2} = 5.9$ h in extract of fly-ash and in tetradecane solution for native congener (Tysklind & Rappe 1991);

$t_{1/2} = 74.5$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = (1.3 - 1.8) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (0.7 - 2.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime of 5.9–22 d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a hexa-chlorinated dibenzofuran at room temp. (Atkinson 1991)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 103, 460 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.26, < 0.1 \text{ d}^{-1}$ (goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_1 = 110 \text{ L kg}^{-1} \text{ d}^{-1}$, $174 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $P_5\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_2 = 0.0138 \text{ d}^{-1}$ with a biological $t_{1/2} = 22$ d (blue mussel, 99-d exposure, Hektoen et al. 1994)

$k_1 = 1310 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.078 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated based on the gas-phase reaction rate constant for a hexa-chlorinated PCDF with OH radicals to be 5.9–22 d (Atkinson 1991);

$t_{1/2} = 1400$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Surface water: $t_{1/2} = 28000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Ground water:

Sediment: $t_{1/2} = 700000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: $t_{1/2} = 700000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Biota: elimination $t_{1/2} = 73$ –156 d in the liver of female Sprague Dawley rats (Van den Berg et al. 1989);

$t_{1/2} = 2.7$ d for PBO treated goldfish and $t_{1/2} > 7$ d for control fish in 120-h exposure studies (Sijm et al. 1993)

biological $t_{1/2} = 22$ d in blue mussel, 99-d exposure experiment (Hektoen et al. 1994).

9.1.1.25 1,2,3,7,8,9-Hexachlorodibenzofuran

Common Name: 1,2,3,7,8,9-Hexachlorodibenzofuran

Synonym: 1,2,3,7,8,9-HxCDF

Chemical Name: 1,2,3,7,8,9-hexachlorodibenzofuran

CAS Registry No: 72918-21-9

Molecular Formula: $C_{12}H_2Cl_6O$, $C_6HCl_3OC_6HCl_3$

Molecular Weight: 374.863

Melting Point ($^{\circ}C$):

246–249 (Rordorf 1989)

230 (calculated, Passivirta et al. 1999)

Boiling Point ($^{\circ}C$):

487.7 (calculated, Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

302.1 (calculated-Le Bas method at normal boiling point)

225.2 (Passivirta et al. 1999)

Ground water:

Sediment: $t_{1/2} = 500000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: $t_{1/2} = 500000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Biota: biological $t_{1/2} = 18$ d in blue mussel, 99-d exposure experiment (Hektoen et al. 1994)

9.1.1.26 1,2,4,6,7,8-Hexachlorodibenzofuran

Common Name: 1,2,4,6,7,8-Hexachlorodibenzofuran

Synonym: 1,2,4,6,7,8-HxCDF

Chemical Name: 1,2,4,6,7,8-hexachlorodibenzofuran

CAS Registry No: 67562-40-7

Molecular Formula: $C_{12}H_2Cl_6O$, $C_6HCl_3OC_6HCl_3$

Molecular Weight: 374.863

Melting Point ($^{\circ}C$):

221–222 (Kuroki et al. 1986; Rordorf 1989; Passivirta et al. 1999)

Boiling Point ($^{\circ}C$):

487.7 (calculated, Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

302.1 (calculated-Le Bas method at normal boiling point)

225.2 (Passivirta et al. 1999)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

86.8 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

137.593 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

48.1 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

97 (Rordorf 1989; Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F:

0.000483 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

0.00451 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 0.944 - 2512/(T/K)$, (supercooled liquid, Passivirta et al. 1999)

2.26×10^{-3} , 4.51×10^{-3} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

3.5×10^{-8} , 2.6×10^{-6} , 1.0×10^{-4} , 2.4×10^{-3} , 0.040 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

1.35×10^{-5} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

9.39×10^{-5} ; 4.53×10^{-8} (supercooled liquid P_L from GC-RT correlation; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 12.81 - 6006/(T/K)$, (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 7.74 - 3497/(T/K)$, (supercooled liquid, Passivirta et al. 1999)

4.47×10^{-6} , 2.35×10^{-5} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

$\log (P_L/mmHg) = 32.31 - 6108/(T/K) - 7.332 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ and reported temperature dependence equations):

1.072 (calculated-SOFA model, Govers & Krop 1998)

$\log [H/(Pa\ m^3/mol)] = 6.80 - 985/(T/K)$, (Passivirta et al. 1999)

1.26; 1.072 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 7.38 (calculated-SOFA model, Govers & Krop 1998)
- 7.51 (estimated-solubility S_L and regression eq. using lit. K_{OW} values, Passivirta et al. 1999)
- 6.83; 7.38 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 4.66 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
- 4.94; 4.66 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

- 8.58 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
- 8.78; 8.58 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: $t_{1/2} = 58.2$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 0.74 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (0.7 - 2.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime of 5.9–22 d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a hexa-chlorinated dibenzofuran at room temp. (Atkinson 1991)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 345, 293 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 < 0.10, > 2.4 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 170 \text{ L kg}^{-1} \text{ d}^{-1}$, $369 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $H_6\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_1 = 1101 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.103 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated based on the gas-phase reaction rate constant for a hexa-chlorinated PCDF with OH radicals to be 5.9–22 d (Atkinson 1991);

suggested $t_{1/2} = 1400$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Surface water: suggested $t_{1/2} = 28000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Ground water:

Sediment: suggested $t_{1/2} = 500000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: suggested $t_{1/2} = 500000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Biota: $t_{1/2} > 7$ d for PBO treated goldfish and $t_{1/2} < 0.3$ d for control fish in 120-h exposure studies (Sijm et al. 1993).

9.1.1.27 1,2,4,6,8,9-Hexachlorodibenzofuran

Common Name: 1,2,4,6,8,9-Hexachlorodibenzofuran

Synonym: 1,2,3,4,8,9-HxCDF

Chemical Name: 1,2,4,6,8,9-hexachlorodibenzofuran

CAS Registry No: 69698-59-5

Molecular Formula: $C_{12}H_2Cl_6O$, $C_6HCl_3OC_6HCl_3$

Molecular Weight: 374.863

Melting Point ($^{\circ}C$):

246–248 (Kuroki et al. 1984; Passivirta et al. 1999)

Boiling Point ($^{\circ}C$):

487.7 (Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

302.1 (calculated-Le Bas method at normal boiling point)

225.2 (Passivirta et al. 1999)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

85.2 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

136.462 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

48.1 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

93 (Rordorf 1989; Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F:

0.000245 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

0.00305 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 0.892 - 2526/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

1.92×10^{-3} , 3.05×10^{-3} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.4×10^{-8} , 1.7×10^{-6} , 6.4×10^{-5} , 1.5×10^{-3} , 0.024 (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

9.22×10^{-6} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1989)

3.55×10^{-6} supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

7.96×10^{-5} ; 1.95×10^{-8} (supercooled liquid P_L from GC-RT correlation; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 12.89 - 6137/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 9.08 - 3629/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

3.89×10^{-6} , 3.55×10^{-6} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

$\log (P_L/mmHg) = 32.22 - 6105/(T/K) - 7.332 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

0.417 (calculated-SOFA model, Govers & Krop 1998)

$\log [H/(Pa \cdot m^3/mol)] = 7.40 - 1117/(T/K)$ (Passivirta et al. 1999)

1.26; 0.417 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 7.43 (calculated-SOFA model, Govers & Krop 1998)
- 7.65 (estimated-solubility S_L and regression eq. using lit. K_{OW} values, Passivirta et al. 1999)
- 6.87; 7.43 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

- 4.84 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
- 4.91; 4.84 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

- 8.58 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
- 8.86; 8.58 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: $t_{1/2} = 82.5$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 0.74 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (0.7 - 2.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime of 5.9–22 d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a hexa-chlorinated dibenzofuran at room temp. (Atkinson 1991)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 170 \text{ L kg}^{-1} \text{ d}^{-1}$, $369 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $H_6\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_2 > 2.0 \text{ d}^{-1}$ (120-h exposure: metabolic inhibitor PBO-treated goldfish, Sijm et al. 1993)

$k_1 = 1101 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.103 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated based on the gas-phase reaction rate constant for a hexa-chlorinated PCDF with OH radicals to be 5.9–22 d (Atkinson 1991);

$t_{1/2} = 1400$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Surface water: $t_{1/2} = 28000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Ground water:

Sediment: $t_{1/2} = 150000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: suggested $t_{1/2} = 150000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Biota: $t_{1/2} < 0.3$ d for PBO treated goldfish in 120-h exposure studies (Sijm et al. 1993).

9.1.1.28 2,3,4,6,7,8-Hexachlorodibenzofuran

Common Name: 2,3,4,6,7,8-Hexachlorodibenzofuran

Synonym: 2,3,4,6,7,8-HCDF

Chemical Name: 2,3,4,6,7,8-hexachlorodibenzofuran

CAS Registry No: 60851-34-5

Molecular Formula: $C_{12}H_2Cl_6O$, $C_6HCl_3OC_6HCl_3$

Molecular Weight: 374.863

Melting Point ($^{\circ}C$):

239–240 (Rordorf 1989)

Boiling Point ($^{\circ}C$):

487.7 (calculated, Rordorf 1989)

Density (g/cm^3):

Molar Volume (cm^3/mol):

302.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

85.7 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

136.794 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

48.1 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} (J/mol K):

94 (Rordorf 1989; quoted, Passivirta et al. 1999)

Fugacity Ratio at 25 $^{\circ}C$, F:

0.000276 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at 25 $^{\circ}C$ or as indicated and reported temperature dependence equations):

0.00156 (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 0.787 - 2527/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

1.24×10^{-3} , 1.56×10^{-3} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at 25 $^{\circ}C$ or as indicated and reported temperature dependence equations):

4.99×10^{-6} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1988, 1991)

5.82×10^{-6} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1989)

3.88×10^{-5} (corrected, supercooled liquid P_L , in Eitzer & Hites 1988, Eitzer & Hites 1998)

2.6×10^{-8} , 1.9×10^{-6} , 7.3×10^{-5} , 1.7×10^{-3} , 0.028 (25, 50, 75, 100, 125 $^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

7.59×10^{-6} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

5.54×10^{-5} ; 1.53×10^{-8} (supercooled liquid P_L from GC-RT correlation; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 12.91 - 6175/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 8.00 - 3651/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

$\log (P_L/mmHg) = 31.99 - 6108/(T/K) - 7.332 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

2.45×10^{-6} , 7.59×10^{-6} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant (Pa $\cdot m^3/mol$ or as indicated and reported temperature dependence equations):

1.78 (calculated-SOFA model, Govers & Krop 1998)

$\log [H/(Pa \cdot m^3/mol)] = 7.21 - 1124/(T/K)$ (Passivirta et al. 1999)

1.26; 1.78 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, log K_{OW} :

- 7.0 (calculated, Broman et al. 1991)
- 7.65 (calculated-SOFA model, Govers & Krop 1998)
- 7.62 (estimated-solubility S_L and regression eq. using lit. K_{OW} values, Passivirta et al. 1999)
- 6.937 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
- 7.01; 7.65 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, log K_{OA} at 25°C or as indicated:

- 12.10 (7°C, GC-retention time correlation, Harner et al. 2000)

Bioconcentration Factor, log BCF or log K_B :

- 4.88 (goldfish, 120-h exposure studies, Sijm et al. 1993)
- 4.99; 4.94; 5.02 (guppies, 21-d exposure, lipid weight basis: measured- C_{fish}/C_W ; calculated; rate constant ratio k_1/k_2 from non-linear regression analysis, Loonen et al. 1994b)
- 4.59 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
- 5.51 (fish muscle log BCF_L calculated from water, Wu et al. 2001)
- 4.81; 4.59 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, log K_{OC} :

- 6.80 (Baltic Sea particulate field samples, concn distribution-GC/MS, Broman et al. 1991)
- 8.96 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
- 9.10; 8.96 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

- Photolysis: photolytic half-life in extract of fly-ash and in tetradecane solution: $t_{1/2} = 2.8$ h for native congener (Tysklind & Rappe 1991);
- $t_{1/2} = 70.7$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

- $k_{OH}(\text{calc}) = 0.74 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)
- $k_{OH} = (0.7 - 2.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime of 5.9–22 d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a hexa-chlorinated dibenzofuran at room temp. (Atkinson 1991)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

- $k_1 = 267 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 < 0.1 \text{ d}^{-1}$ (goldfish after 120-h exposure: control fish, Sijm et al. 1993)
- $k_2 = 0.36$ (metabolic inhibitor PBO-treated goldfish, 120-h exposure studies, Sijm et al. 1993)
- $k_1 = 110 \text{ L kg}^{-1} \text{ d}^{-1}$, $174 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for P₅CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)
- $k_2 = 0.0119 \text{ d}^{-1}$ with a biological $t_{1/2} = 25$ d (blue mussel, 99-d exposure, Hektoen et al. 1994)

Half-Lives in the Environment:

- Air: tropospheric lifetime was calculated based on the gas-phase reaction rate constant for a hexa-chlorinated PCDF with OH radicals to be 5.9–22 d (Atkinson 1991);

$t_{1/2} = 1400$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

- Surface water: $t_{1/2} = 28000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

Ground water:

- Sediment: $t_{1/2} = 500000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

- Soil: $t_{1/2} = 500000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000)

- Biota: $t_{1/2} = 1.9$ d for PBO treated goldfish and $t_{1/2} > 7$ d for control fish in 120-h exposure studies (Sijm et al. 1993). biological $t_{1/2} = 25$ d in blue mussel, 99-d exposure experiment (Hektoen et al. 1994)

9.1.1.29 1,2,3,4,6,7,8-Heptachlorodibenzofuran

Common Name: 1,2,3,4,6,7,8-Heptachlorodibenzofuran

Synonym: 1,2,3,4,6,7,8-HCDF

Chemical Name: 1,2,3,4,6,7,8-Heptachlorodibenzofuran

CAS Registry No: 67562-39-4

Molecular Formula: $C_{12}HCl_7O$, $C_6HCl_3OC_6Cl_4$

Molecular Weight: 409.308

Melting Point ($^{\circ}C$):

236–237 (Kuroki et al. 1984; Rordorf 1989; Della Site 1997)

Boiling Point ($^{\circ}C$):

507.2 (calculated, Rordorf 1989)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

323.0 (calculated-Le Bas method at normal boiling point)

238.1 (Ruelle & Kesselring 1997; quoted, Passivirta et al. 1999)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

87.8 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

144.642 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

53.9 (Rordorf 1989; quoted, Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

106 (Rordorf 1989; quoted, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F:

0.000122 (calculated- ΔS_{fus} and mp, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

1.35×10^{-6} ($22.7^{\circ}C$, generator column-GC/MS, Friesen et al. 1990)

1.08×10^{-5} (calculated-QSAR, Fiedler & Schramm 1990)

9.50×10^{-7} (computed-expert system SPARC, Kollig 1995)

1.26×10^{-7} (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

1.63×10^{-4} ; 7.11×10^{-4} (supercooled liquid S_L , quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 0.917 - 2812/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

4.92×10^{-4} , 7.11×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

2.24×10^{-6} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1988, 1991; quoted, Della Site 1997)

1.93×10^{-6} (supercooled liquid P_L GC-RT correlation, Eitzer & Hites 1989; quoted, Della Site 1997)

4.7×10^{-9} , 4.3×10^{-7} , 2.0×10^{-5} , 5.8×10^{-4} , 1.1×10^{-2} (25 , 50 , 75 , 100 , $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

5.10×10^{-8} (gas saturation method, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)

8.70×10^{-9} (computed-expert system SPARC, Kollig 1995)

1.83×10^{-8} , 1.58×10^{-8} (P_s solid vapor pressure calculated from reported P_L , Della Site 1997)

1.84×10^{-5} (corrected supercooled liquid P_L in Eitzer & Hites 1988, Eitzer & Hites 1998)

1.4×10^{-6} ; 2.51×10^{-6} (supercooled liquid P_L , quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

5.54×10^{-5} ; 6.76×10^{-9} (supercooled liquid P_L from GC-RT correlation; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 12.98 - 6302/(T/K)$ (solid, Passivirta et al. 1999)
 $\log (P_L/Pa) = 7.45 - 3486/(T/K)$ (supercooled liquid, Passivirta et al. 1999)
 $\log (P_L/mmHg) = 30.03 - 6090/(T/K) - 6.798 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)
 9.33×10^{-7} , 2.51×10^{-6} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($Pa \text{ m}^3/\text{mol}$ at 25°C):

3.80 (computed-expert system SPARC, Kollig 1995)
 3.47; 1.41 (quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 $\log [H/(Pa \text{ m}^3/\text{mol})] = 6.53 - 674/(T/K)$ (Passivirta et al. 1999)
 1.41; 1.41 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

7.92 (shake flask/slow stirring-GC/MS, from fly-ash extract, Sijm et al. 1989a)
 9.25 (calculated-QSAR, Friedler & Schramm 1990)
 7.90 (quoted, Loonen et al. 1991)
 8.10 (calculated, Broman et al. 1991)
 7.92 (recommended, Hansch et al. 1995)
 8.52 (computed-expert system SPARC, Kollig 1995)
 8.01 (calculated-SOFA model, Govers & Krop 1998)
 8.07 (calculated-solubility $\log S_L$ and regression from lit. $\log K_{ow}$, Passivirta et al. 1999)
 7.477 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
 7.37; 8.00 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

12.06 (7°C , GC-retention time indices correlation, Harner et al. 2000)

Bioconcentration Factor, $\log BCF$:

4.46; 4.08 (guppy, 21-d exposure, lipid wt: system I - absence of sediment; system II - with presence of sediment, Loonen et al. 1994a)
 4.46; 4.60; 4.63 (guppy, 21-d exposure, lipid wt basis: measured- C_{fish}/C_w ; calculated; rate constant ratio k_1/k_2 from non-linear regression analysis, Loonen et al. 1994b)
 4.46; 4.26 (lipid wt basis, quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 6.62; 6.92 (wet wt basis, fish 5% lipid, 10% lipid, Geyer et al. 2000)
 5.89, 6.03 (fish muscle $\log BCF_L$ calculated from water, sediment, Wu et al. 2001)
 4.51; 4.26 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

6.37 (organic carbon, calculated-QSAR, Friedler & Schramm 1990)
 6.00 (organic carbon, calculated, Broman et al. 1991)
 7.90 (calculated, Broman et al. 1991)
 8.20 (computed- K_{ow} , Kollig 1995)
 9.07; 9.48 (sediment/water, quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 9.64; 9.48 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photolytic degradation $t_{1/2} = 9.8 \text{ h}$ with extract of fly-ash and in tetradecane solution for native congener and $t_{1/2} = 3.7 \text{ h}$ for ^{13}C -labelled congener (Tysklind & Rappe 1991).

$t_{1/2} = 84.5 \text{ h}$ on spruce needle surfaces under sunlight irradiation (Niu et al. 2003).

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{O_3}(aq.) = 1.08 \times 10^5 \text{ L g}^{-1} \text{ min}^{-1}$, oxidative degradation rate constant of water dissolved PCDF by ozone under alkaline conditions at pH 10 and 20°C (Palauschek & Scholz 1987)

$k_{OH}(calc) = 0.53 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (0.5 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime $\tau = 17\text{--}31 \text{ d}$, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a hepta-chlorinated dibenzofuran at room temp. (Atkinson 1991)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 42, 61 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.43, 0.1 \text{ d}^{-1}$ (metabolic inhibitor PBO-treated goldfish, control fish, 120-h exposure studies, Sijm et al. 1993)

$k_1 = 42 \text{ L kg}^{-1} \text{ d}^{-1}$, $61 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for P₅CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

$k_2 = 0.0084 \text{ d}^{-1}$ with a biological $t_{1/2} = 36 \text{ d}$ (blue mussel, 99-d exposure, Hektoen et al. 1994)

$k_1 = 524 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.127 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated based on the gas-phase reaction rate constant for a hepta-chlorinated PCDF with OH radicals to be 17–31 d (Atkinson 1991);

$t_{1/2} = 3200 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: $t_{1/2} = 64\,000 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: very persistent $t_{1/2} = 36 \text{ yr}$ (Geyer et al. 2000)

degradation $t_{1/2} = 2\text{--}200 \text{ yr}$ for all homologues (estimated, Suzuki et al. 2000);

$t_{1/2} = 350\,000 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: degradation $t_{1/2} = 5\text{--}50 \text{ yr}$ (estimated, Suzuki et al. 2000);

$t_{1/2} = 350\,000 \text{ h}$ at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: depuration $t_{1/2} > 336 \text{ d}$ for carp in Lake Superior water (Kuehl et al. 1987);

elimination $t_{1/2} = 33.9 \text{ d}$ from lactating cow (Olling et al. 1991);

$t_{1/2} = 1.6 \text{ d}$ for PBO treated goldfish and $t_{1/2} = 6.8 \text{ d}$ for control fish in 120-h exposure studies (Sijm et al. 1993).

biological $t_{1/2} = 37 \text{ d}$ in blue mussel, 99-d exposure experiment (Hektoen et al. 1994)

9.1.1.30 1,2,3,4,6,8,9-Heptachlorodibenzofuran

Common Name: 1,2,3,4,6,8,9-Heptachlorodibenzofuran

Synonym: 1,2,3,4,6,8,9-HpCDF

Chemical Name: 1,2,3,4,6,8,9-Heptachlorodibenzofuran

CAS Registry No: 69698-58-4

Molecular Formula: $C_{12}HCl_7O$, $C_6HCl_3OC_6Cl_4$

Molecular Weight: 409.308

Melting Point ($^{\circ}C$):

211–212 (Kuroki et al. 1984; Rordorf 1989; Della Site 1997)

Boiling Point ($^{\circ}C$):

507.2 (calculated, Rordorf 1989)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

323.0 (calculated-Le Bas method)

238.1 (Ruelle & Kesselring 1997; quoted, Passivirta et al. 1999)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

89.2 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

145.64 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

53.9 (Rordorf 1989; quoted, Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

111 (Rordorf 1989; quoted, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F:

0.00021 (calculated- ΔS_{fus} and mp, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

5.65×10^{-4} (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 1.200 - 2861/(T/K)$, (supercooled liquid, Passivirta et al. 1999)

4.19×10^{-4} , 5.65×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

7.7×10^{-9} , 7.2×10^{-7} , 3.6×10^{-5} , 1.0×10^{-3} , 2.0×10^{-2} (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1989)

7.24×10^{-7} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

1.55×10^{-5} ; 3.57×10^{-9} (supercooled liquid P_L from GC-RT correlation; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 13.03 - 6394/(T/K)$, (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 7.23 - 3581/(T/K)$, (supercooled liquid, Passivirta et al. 1999)

8.13×10^{-7} , 7.24×10^{-7} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

$\log (P_L/mmHg) = 29.94 - 6089/(T/K) - 6.798 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

5.13 (calculated-SOFA model, Govers & Krop 1998)

$\log [H/(Pa \cdot m^3/mol)] = 6.03 - 756/(T/K)$, (Passivirta et al. 1999)

1.45; 5.13 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 8.02 (calculated-SOFA model, Govers & Krop 1998)
 7.91 (calculated-solubility $\log S_L$ and regression from lit. $\log K_{OW}$, Passivirta et al. 1999)
 7.43; 8.02 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:Bioconcentration Factor, $\log BCF$:

- 4.42 (lipid wt basis, calculated-SOFA model, Govers & Krop 1998)
 4.46; 4.42 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

- 9.45 (sediment/water, calculated-SOFA model, Govers & Krop 1998)
 9.72; 9.45 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: $t_{1/2} = 85.6$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003)

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 0.53 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (0.5 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime of 17–31 d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a hepta-chlorinated dibenzofuran at room temp. (Atkinson 1991)

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 42 \text{ L kg}^{-1} \text{ d}^{-1}$, $61 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for $H_7\text{CDD}$ homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated based on the gas-phase reaction rate constant for a hepta-chlorinated PCDF with OH radical to be 17–31 d (Atkinson 1991);

suggested $t_{1/2} = 3200$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: suggested $t_{1/2} = 64\,000$ h at 7°C in Baltic Proper environment (Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: degradation $t_{1/2} = 2\text{--}200$ yr for all homologues (estimated, Suzuki et al. 2000);

suggested $t_{1/2} = 350\,000$ h at 7°C in Baltic Proper environment (Sinkkonen & Passivirta 2000).

Soil: degradation $t_{1/2} = 5\text{--}50$ yr (estimated, Suzuki et al. 2000);

suggested $t_{1/2} = 350\,000$ h at 7°C in Baltic Proper environment (Sinkkonen & Passivirta 2000).

Biota:

9.1.1.31 1,2,3,4,7,8,9-Heptachlorodibenzofuran

Common Name: 1,2,3,4,7,8,9-Heptachlorodibenzofuran

Synonym: 1,2,3,4,7,8,9-HCDF

Chemical Name: 1,2,3,4,7,8,9-Heptachlorodibenzofuran

CAS Registry No: 55673-89-7

Molecular Formula: $C_{12}HCl_7O$, $C_6HCl_3OC_6Cl_4$

Molecular Weight: 409.308

Melting Point ($^{\circ}C$):

221–223 (Kuroki et al. 1984)

Boiling Point ($^{\circ}C$):

507.2 (calculated, Rordorf 1989)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

323.0 (calculated-Le Bas method at normal boiling point)

248.1 (Passivirta et al. 1999)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

88.6 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

145.221 (Rordorf 1989)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

53.9 (Rordorf 1989)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

109 (Rordorf 1989; quoted, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F:

0.000179 (calculated- ΔS_{fus} and mp, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

1.30×10^{-6} (computed-expert system SPARC, Kollig 1995)

2.58×10^{-4} (supercooled liquid S_L , calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 1.100 - 2819/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

2.83×10^{-4} , 2.58×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

6.2×10^{-9} , 5.8×10^{-7} , 2.8×10^{-5} , 8.0×10^{-4} , 1.5×10^{-2} (25, 50, 75, 100, $125^{\circ}C$, predicted-vapor pressure correlation method, Rordorf 1987, 1989)

1.305×10^{-6} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1988, 1991)

1.011×10^{-6} (supercooled liquid P_L , GC-RT correlation, Eitzer & Hites 1989)

1.27×10^{-9} (computed-expert system SPARC, Kollig 1995)

1.48×10^{-8} , 1.14×10^{-8} (solid vapor pressures calculated from reported P_L , Della Site 1997)

6.61×10^{-7} (supercooled liquid P_L , calculated-SOFA model, Govers & Krop 1998)

7.87×10^{-6} ; 1.41×10^{-9} (supercooled liquid P_L from GC-RT correlation; converted to solid P_S with fugacity ratio F, Passivirta et al. 1999)

$\log (P_S/Pa) = 13.12 - 6547/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 7.23 - 3581/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

$\log (P_L/mmHg) = 29.69 - 6089/(T/K) - 6.798 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

5.75×10^{-7} , 6.60×10^{-7} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ or as indicated and reported temperature dependence equations):

- 3.85 (computed-expert system SPARC, Kollig 1995)
- 1.0 (calculated-SOFA model, Govers & Krop 1998)
- $\log [H/(\text{Pa m}^3/\text{mol})] = 6.32 - 912/(T/K)$ (Passivirta et al. 1999)
- 1.58; 1.0 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

- 6.90 (calculated, Broman et al. 1991)
- 8.50 (computed-expert system SPARC, Kollig 1995)
- 8.23 (calculated-SOFA model, Govers & Krop 1998)
- 7.99 (calculated-solubility $\log S_L$ and regression from lit. $\log K_{OW}$, Passivirta et al. 1999)
- 7.616 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
- 7.60; 8.23 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25 °C or as indicated:

- 12.34 (7°C, GC-retention time correlation, Harner et al. 2000)

Bioconcentration Factor, $\log BCF$:

- 4.32 (calculated-SOFA model, Govers & Krop 1998)
- 5.59 (fish muscle $\log BCF_L$ calculated from water, Wu et al. 2001)
- 4.30; 4.32 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

- 5.00 (organic carbon, calculated, Broman et al. 1991)
- 6.70 (calculated, Broman et al. 1991)
- 8.23 (computed- K_{OW} , Kollig 1995)
- 9.78; 9.76 (sediment/water, quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
- 9.92; 9.76 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photolysis $t_{1/2} = 3.3$ h in the extract from fly ash in tetradecane, for ^{13}C labelled congener (Tysklind & Rappe 1991)

$t_{1/2} = 84.5$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003).

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{calc}) = 0.92 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{OH} = (0.5 - 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime of 17–31 d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for a hepta-chlorinated dibenzofuran at room temp. (Atkinson 1991)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_1 = 42 \text{ L kg}^{-1} \text{ d}^{-1}$, $61 \text{ L kg}^{-1} \text{ d}^{-1}$ (average k_1 for H_7CDD homolog group, goldfish after 120-h exposure: metabolic inhibitor PBO-treated, control fish, Sijm et al. 1993)

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated based on the gas-phase reaction rate constant for a hepta-chlorinated PCDF, with OH radicals to be 17–31 d (Atkinson 1991);

$t_{1/2} = 3200$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: $t_{1/2} = 64\,000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: degradation $t_{1/2} = 20\text{--}200$ y for all homologues (estimated, Suzuki et al. 2000);

$t_{1/2} = 300\,000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: degradation $t_{1/2} = 5\text{--}50$ yr (estimated, Suzuki et al. 2000);

$t_{1/2} = 300\,000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota:

9.1.1.32 Octachlorodibenzofuran

Common Name: Octachlorodibenzofuran

Synonym: OCDF

Chemical Name: octachlorodibenzofuran

CAS Registry No: 39001-02-0

Molecular Formula: $C_6Cl_4OC_6Cl_4$

Molecular Weight: 443.753

Melting Point ($^{\circ}C$):

258–260 (Rordorf 1986,1989)

259 (Ruelle & Kesselring 1997, Passivirta et al. 1999)

Boiling Point ($^{\circ}C$):

510 (calculated, Rordorf 1986)

537 (calculated, Rordorf 1989)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

343.9 (calculated-Le Bas method at normal boiling point)

251.0 (Ruelle & Kesselring 1997, quoted, Passivirta et al. 1999)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

90 (Rordorf 1989)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

149.43 (Rordorf 1989)

284.38 (Dickhut et al. 1994)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

57.5 (Rordorf 1989; quoted, Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} (J/mol K):

108 (Rordorf 1986,1989; quoted, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$, F:

0.00518 (calculated-assuming $\Delta S_{fus} = 56$ J/mol K and mp = $258^{\circ}C$)

0.000037 (calculated- ΔS_{fus} and mp, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

1.16×10^{-6} * (extrapolated, generator column-GC, measured range 39.8 – $80^{\circ}C$, Doucette & Andren 1988a)

$S/(mol/L) = 2.77 \times 10^{-14} \exp(0.081 \cdot t/^{\circ}C)$ (generator column-GC/ECD, temp range 40 – $80^{\circ}C$, Doucette & Andren 1988a)

$\log x = -3264/(T/K) - 2.376$, temp range 40 – $80^{\circ}C$ (generator column-GC/ECD, Doucette & Andren 1988a)

1.54×10^{-6} (calculated-QSAR, Fiedler & Schramm 1990)

1.37×10^{-7} (calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

2.33×10^{-4} ; 1.02×10^{-4} (supercooled liquid S_L , quoted exptl.; calculated-SOFA model, Govers & Krop 1998)

$\log [S_L/(mol/L)] = 0.5720 - 3008/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

$\ln x = -5.0496 - 7455.1/(T/K)$; temp range 5 – $50^{\circ}C$ (regression eq. of literature data, Shiu & Ma 2000)

1.22×10^{-4} , 1.02×10^{-4} (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

5.00×10^{-10} * (gas saturation, Rordorf 1985, 1989)

2.60×10^{-7} (supercooled liquid P_L , GC-RC correlation, Eitzer & Hites 1989)

0.000221* (105.6 °C, average value, gas saturation-GC, measured range 105.6–261.2 °C, Rordorf 1990)
 5.00×10^{-10} (gas saturation, estimated from extrapolated vapor pressure vs. halogen substitution no. plot, Rordorf et al. 1990)
 1.26×10^{-9} (solid vapor pressure calculated from reported P_L , Delle Site 1997)
 7.08×10^{-7} ; 1.82×10^{-7} (supercooled liquid P_L , quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 1.30×10^{-6} ; 4.83×10^{-11} (supercooled liquid P_L from GC-RT correlation; converted to solid P_S with fugacity ratio F, Passivirta et al. 1999)
 $\log (P_S/\text{Pa}) = 13.42 - 7073/(T/K)$ (solid, Passivirta et al. 1999)
 $\log (P_L/\text{Pa}) = 7.77 - 4068/(T/K)$ (supercooled liquid, Passivirta et al. 1999)
 $\log (P/\text{Pa}) = 16.88937 - 7808.74/(T/K)$; temp range 5–50°C (regression eq. from literature data, Shiu & Ma 2000)
 0.107* (165 °C, Knudsen effusion, measured range 165–195°C, Li et al. 2002)
 $\log (P_L/\text{mmHg}) = 27.96 - 6148/(T/K) - 6.267 \cdot \log (T/K)$ (supercooled liquid P_L , Kirchoff/Rankin eq., GC-RI correlation, Mader & Pankow 2003)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ or as indicated and reported temperature dependence equations):

0.10 (estimated, Clark & Mackay 1991)
 1.31; 0.776 (quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 $\log [H/(\text{Pa m}^3/\text{mol})] = 7.20 - 1060/(T/K)$ (Passivirta et al. 1999)
 2.14; 0.776 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

13.06, 13.22, 13.78; 12.54, 13.37, 13.93 (HPLC-RT correlation, linear regressions; quadratic regressions, Sarna et al. 1984)
 8.78 (re-evaluated HPLC-RT data, Burkhard & Kuehl 1986)
 7.97 (generator column-GC/ECD, Doucette & Andren 1987, 1988b)
 7.90 (HPLC-RT correlation, Doucette & Andren 1988b)
 7.97 (recommended, Hansch et al. 1995)
 8.78; 8.60 (quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 8.62 (calculated-solubility $\log S_L$ and regression from lit. $\log K_{OW}$, Passivirta et al. 1999)
 7.992 (calculated-QSPR by PM3 Hamiltonian descriptors and partial least-square analysis, Chen et al. 2001)
 8.03; 8.60 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated:

12.84 (7°C, GC-retention time indices correlation, Harner et al. 2000)

Bioconcentration Factor, $\log BCF$:

1.613, 0.70 (human fat, calculated-different K_{OWS} , wet weight basis, Geyer et al. 1987)
 1.71, 0.778 (human fat, calculated-different K_{OWS} , lipid basis, Geyer et al. 1987)
 2.77; 3.89 (guppy, wet weight based; lipid weight based, Gobas & Schrap 1990)
 3.90; 4.10; 4.11 (guppies, 21-d exposure, lipid wt basis: measured- C_{fish}/C_w ; calculated; rate constant ratio k_1/k_2 from non-linear regression analysis, Loonen et al. 1994b)
 3.90; 3.88 (lipid wt basis, quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 7.48; 7.78 (wet wt basis: fish with 5% lipid, with 10% lipid, Geyer et al. 2000)
 7.61, 7.63 (fish muscle $\log BCF_L$ calculated from water, sediment, Wu et al. 2001)
 3.85; 3.88 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Sorption Partition Coefficient, $\log K_{OC}$:

6.75 (calculated-QSAR, Fiedler & Schramm 1990)
 6.00 (organic carbon, calculated, Broman et al. 1991)
 7.40 (calculated, Broman et al. 1991)
 7.40 (Baltic Sea particulate field samples, concn distribution-GC/MS, Broman et al. 1991)
 8.13, 8.48 (calculated- K_{OW} , Kollig 1993)
 10.49; 10.30 (sediment/water, quoted exptl.; calculated-SOFA model, Govers & Krop 1998)
 10.39; 10.30 (GC-RI correlation; calculated-SOFA method, Wang & Wong 2003)

Environmental Fate Rate Constants, k , or Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photolytic $t_{1/2} = 2.1$ h from extract of fly ash in tetradecane solution for native congener (Tysklind & Rappe 1991);

photolysis $k = 2.7 \times 10^{-3} \text{ min}^{-1}$ with $t_{1/2} = 260$ min in pure water and $t_{1/2} = 6.3 \times 10^{-3} \text{ min}^{-1}$ with $t_{1/2} = 110$ min in 60% acetonitrile/water at 300 nm photochemical reactor; $k = 0.11 \text{ h}^{-1}$ with $t_{1/2} = 6.5$ h in pure water in sunlight at 42°N latitude in middle of July (Kim & O'Keefe 2000).

$t_{1/2} = 100.5$ h on spruce needle surfaces under sunlight irradiation (Niu et al. 2003).

Hydrolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

k (oxidative degradation rate constant of water dissolved OCDF by ozone) is $1.05 \times 10^4 \text{ L g}^{-1} \text{ min}^{-1}$ under alkaline conditions at pH 10 and 20°C (Palauschek & Scholz 1987)

$k_{\text{OH}}(\text{calc}) = 0.39 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1991)

$k_{\text{OH}} = 0.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with calculated tropospheric lifetime $\tau = 39$ d, using a 12-h average daytime OH radical concn of $1.5 \times 10^6 \text{ molecule/cm}^3$ for OCDF at room temp. (Atkinson 1991)

photodegradation $t_{1/2} = 9$ h for OCDF adsorbed to clean silica gels in a rotary photo-reactor by filtered < 290 nm of light (Koester & Hites 1992)

Biodegradation:

Biotransformation: metabolism half-time 10^7 h (guppy, Clark & Mackay 1991).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants:

$k_2 = 0.012 \text{ d}^{-1}$ (rainbow trout, Niimi & Oliver 1986)

$k_1 = 824 \text{ d}^{-1}$; $k_2 = 1.40 \text{ d}^{-1}$ (guppy, Gobas & Schrap 1990)

$k_2 = 0.0101 \text{ d}^{-1}$ with a biological $t_{1/2} = 30$ d (blue mussel, 99-d exposure, Hektoen et al. 1994)

$k_1 = 217 \text{ L kg}^{-1} \text{ d}^{-1}$; $k_2 = 0.174 \text{ d}^{-1}$ (guppy, 21-d exposure, wet wt base, Loonen et al. 1994b)

Half-Lives in the Environment:

Air: tropospheric lifetime was calculated based on the gas-phase reaction rate constant for OCDF with OH radicals to be 39 d (Atkinson 1991);

$t_{1/2} = 9600$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Surface water: photolysis $k = 2.7 \times 10^{-3} \text{ min}^{-1}$ with $t_{1/2} = 260$ min in pure water and $k = 6.3 \times 10^{-3} \text{ min}^{-1}$ with $t_{1/2} = 110$ min in 60% acetonitrile/water at 300 nm photochemical reactor; $k = 0.11 \text{ h}^{-1}$ with a $t_{1/2} = 6.5$ h in pure water in sunlight at 42°N latitude in middle of July (Kim & O'Keefe 2000);

$t_{1/2} = 192000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Groundwater:

Sediment: very persistent $t_{1/2} = 29$ yr (Geyer et al. 2000)

degradation $t_{1/2} = 20\text{--}200$ yr for all homologues (estimated, Suzuki et al. 2000);

$t_{1/2} = 250\,000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Soil: degradation $t_{1/2} = 5\text{--}50$ yr (estimated, Suzuki et al. 2000);

$t_{1/2} = 250000$ h at 7°C in Baltic Proper environment (estimated, Sinkkonen & Passivirta 2000).

Biota: mean biological $t_{1/2} = 7$ d in rainbow trout (Niimi 1986)

$t_{1/2} = 7$ to 12 d in rainbow trout (Niimi & Oliver 1986)

biological $t_{1/2} = 30$ d in blue mussel, 99-d exposure experiment (Hektoen et al. 1994)

TABLE 9.2.3

Suggested half-life classes of polychlorinated dibenzofurans in various environmental compartments at 25°C

Compound	Air class	Water class	Soil class	Sediment class
Dibenzofuran	3	4	6	7
2,8-Dichloro-	4	5	7	8
2,3,7,8-Tetrachloro-	4	5	8	9
2,3,4,7,8-Pentachloro-	5	5	8	9
1,2,3,4,6,7,8-Heptachloro-	5	6	8	9
Octachlorodibenzofuran	5	7	9	9

where,

Class	Mean half-life (hours)	Range (hours)
1	5	< 10
2	17 (~ 1 day)	10–30
3	55 (~ 2 days)	30–100
4	170 (~ 1 week)	100–300
5	550 (~ 3 weeks)	300–1,000
6	1700 (~ 2 months)	1,000–3,000
7	5500 (~ 8 months)	3,000–10,000
8	17000 (~ 2 years)	10,000–30,000
9	55000 (~ 6 years)	> 30,000

10.1.3.14	Tetrachloroveratrole	2347
10.1.3.15	Phenetole	2348
10.1.3.16	Benzyl ethyl ether	2351

10.1.3.17	Styrene oxide	2353
10.1.3.18	Diphenyl ether	2355
10.1.4	Polychlorinated diphenyl ethers (PCDEs)	2359
10.1.4.1	2-Chlorodiphenyl ether (PCDE-1)	2359
10.1.4.2	4-Chlorodiphenyl ether	2360
10.1.4.3	2,4-Dichlorodiphenyl ether (PCDE-8)	2362
10.1.4.4	2,6-Dichlorodiphenyl ether (PCDE-10)	2363
10.1.4.5	2,4,4'-Trichlorodiphenyl ether (PCDE-28)	2364
10.1.4.6	2,4,5-Trichlorodiphenyl ether (PCDE-29)	2365
10.1.4.7	2,4',5-Trichlorodiphenyl ether (PCDE-31)	2367
10.1.4.8	2,2',4,4'-Tetrachlorodiphenyl ether (PCDE-47)	2368
10.1.4.9	2,3',4,4'-Tetrachlorodiphenyl ether (PCDE-66)	2369
10.1.4.10	2,4,4',5-Tetrachlorodiphenyl ether (PCDE-74)	2370
10.1.4.11	3,3',4,4'-Tetrachlorodiphenyl ether (PCDE-77)	2371
10.1.4.12	2,2',3,4,4'-Pentachlorodiphenyl ether (PCDE-85)	2373
10.1.4.13	2,2',4,4',5-Pentachlorodiphenyl ether (PCDE-99)	2374
10.1.4.14	2,2',4,4',6-Pentachlorodiphenyl ether (PCDE-100)	2376
10.1.4.15	2,2',4,5,5'-Pentachlorodiphenyl ether (PCDE-101)	2378
10.1.4.16	2,3,3',4,4'-Pentachlorodiphenyl ether (PCDE-105)	2379
10.1.4.17	3,3',4,4',5-Pentachlorodiphenyl ether (PCDE-126)	2380
10.1.4.18	2,2',3,3',4,4'-Hexachlorodiphenyl ether (PCDE-128)	2381
10.1.4.19	2,2',3,4,4',5-Hexachlorodiphenyl ether (PCDE-137)	2382
10.1.4.20	2,2',3,4,4',5'-Hexachlorodiphenyl ether (PCDE-138)	2384
10.1.4.21	2,2',3,4,4',6-Hexachlorodiphenyl ether (PCDE-140)	2385
10.1.4.22	2,2',4,4',5,5'-Hexachlorodiphenyl ether (PCDE-153)	2386
10.1.4.23	2,2',4,4',5,6'-Hexachlorodiphenyl ether (PCDE-154)	2388
10.1.4.24	2,3',4,4',5,5'-Hexachlorodiphenyl ether (PCDE-167)	2390
10.1.4.25	2,2',3,4,4',5,5'-Heptachlorodiphenyl ether (PCDE-180)	2392
10.1.4.26	2,2',3,4,4',5,6'-Heptachlorodiphenyl ether (PCDE-182)	2394
10.1.4.27	2,2',3,4,4',6,6'-Heptachlorodiphenyl ether (PCDE-184)	2395
10.1.4.28	2,2',3,3',4,4',5,5'-Octachlorodiphenyl ether (PCDE-194)	2396
10.1.4.29	2,2',3,3',4,4',5,6'-Octachlorodiphenyl ether (PCDE-196)	2397
10.1.4.30	2,2',3,3',4,4',6,6'-Octachlorodiphenyl ether (PCDE-197)	2398
10.1.4.31	2,2',3,3',4,4',5,5',6-Nonachlorodiphenyl ether (PCDE-206)	2399
10.1.4.32	Decachlorodiphenyl ether (PCDE-209)	2400

10.1 LIST OF CHEMICALS AND DATA COMPILATIONS

10.1.1 ALIPHATIC ETHERS

10.1.1.1 Dimethyl ether (Methyl ether)

Common Name: Dimethyl ether

Synonym: methyl ether, oxapropane, oxybismethane

Chemical Name: dimethyl ether, methyl ether,

CAS Registry No: 115-10-6

Molecular Formula: C_2H_6O , CH_3OCH_3

Molecular Weight: 46.068

Melting Point ($^{\circ}C$):

–138.5 (Stull 1947; Stephenson & Malanowski 1987)

–141.5 (Riddick et al. 1986; Lide 2003)

Boiling Point ($^{\circ}C$):

–24.75 (Ambrose et al. 1976)

–23.60 (Stephenson & Malanowski 1987)

–24.8 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.6689 (Riddick et al. 1986)

0.6612 ($25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

68.87 ($20^{\circ}C$, calculated-density)

60.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

4.941 (Riddick et al. 1986; Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated):

71000 (Seidell 1941; Lange 1971)

35.3% ($24^{\circ}C$, selected, Riddick et al. 1986)

65200 (literature data compilation, Yaws et al. 1990)

47480 (calculated- V_M , Wang et al. 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

100847* ($-24.91^{\circ}C$, static method-manometer, measured range -78.22 to $-24.91^{\circ}C$, Kennedy et al. 1941)

678090* (calculated-Antoine eq. regression, temp range -115.7 to $-23.7^{\circ}C$, Stull 1947)

$\log(P/mmHg) = [-0.2185 \times 5409.8/(T/K)] + 7.585479$; temp range -115.7 to $125.2^{\circ}C$ (Antoine eq., Weast 1972–73)

593300 (Ambrose et al. 1976, Riddick et al. 1986)

$\log(P/kPa) = 6.0823 - 882.52/\{(T/K) + 31.90\}$ (Antoine eq., Ambrose et al. 1976)

$\log(P/mmHg) = 6.97603 - 889.3645/(241.96 + t/^{\circ}C)$; temp range -71 to $-25^{\circ}C$ (Antoine eq., Dean 1985, 1992)

$\log(P/kPa) = 5.44136 - 1025.56/(256.05 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

575530, 593340 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.44136 - 1025.56/(-17.1 + T/K)$; temp range 183–265 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.30358 - 982.46/(-20.894 + T/K)$, temp range not specified (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.36332 - 995.747/(-19.864 + T/K)$; temp range 180–249 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.09354 - 880.813/(-33.007 + T/\text{K})$; temp range 241–303 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.28318 - 987.484/(-16.813 + T/\text{K})$; temp range 293–360 K (Antoine eq.-V, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 7.48877 - 1971.127/(122.787 + T/\text{K})$; temp range 349–400 K (Antoine eq.-VI, Stephenson & Malanowski 1987)

374000* (10°C, vapor-liquid equilibrium, measured range 203.15–395 K, Noles & Zollweg 1992)

$\log (P/\text{mmHg}) = 20.2699 - 1.5914 \times 10^3/(T/\text{K}) - 4.653 \cdot \log (T/\text{K}) - 1.3178 \times 10^{-10} \cdot (T/\text{K}) + 2.5623 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 132–400 K (vapor pressure eq., Yaws et al. 1994)

510000* (20.5°C, vapor-liquid equilibrium, measured range 0.51–120.12°C, Jónasson et al. 1995)

589100 (25.02°C, vapor-liquid equilibrium, measured range 283.12–313.22 K, Bobbo et al. 2000)

596210* (25.022°C, static-pressure sensor, measured range 233–399 K, data fitted to Wagner type eq., Wu et al. 2004)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

101.0 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

49.5, 105.7 (calculated-group contribution, calculated-bond contribution method, Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.10 (shake flask-GC, Leo et al. 1975; Hansch & Leo 1987)

0.10 (recommended, Sangster 1989)

0.10 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

1.37 (calculated- S_{oct} and vapor pressure P , Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{O(3P)} = 5.7 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the reaction with $O(3P)$ at room temp. (Gaffney & Levine 1979)

$k_{OH}^* = 3.50 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298.9 K, measured range 298–505 K (flash photolysis-resonance fluorescence, Perry et al. 1977)

$k_{OH}(\text{calc}) = 2.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 2.98 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{NO_3} \leq 3.0 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ (flash photolysis-visible absorption, Wallington et al. 1986; quoted, Sabljic & Güsten 1990; Atkinson 1991)

$k_{OH}^* = 2.95 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K, measured range 295–442 K (Tully & Droege 1987)

$k_{NO_3} = 2.92 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Sabljic & Güsten 1990)

$k_{OH}(\text{exptl}) = 2.98 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 1.98 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}^* = (24.9 \pm 2.2) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 240–440 K (flash photolysis-resonance fluorescence, Wallington et al. 1988b)

$k_{OH} = 2.49 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 1.7 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988a)

$k_{OH}^* = 2.98 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989, 1990)

$k_{OH} = (2.35 \pm 0.24) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse radiolysis-UV spectroscopy; $k_{OH} = (3.19 \pm 0.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method, at $298 \pm 2 \text{ K}$ (Nelson et al. 1990)

$k_{OH}^* = 2.95 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K, measured range 295–650 K (laser photolysis-laser induced fluorescence technique, Arif et al. 1997)

$k_{\text{OH}}^* = 2.86 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 263–351 K (relative rate method, DeMore & Bayes 1999)

FIGURE 10.1.1.1 Logarithm of vapor pressure versus reciprocal temperature for dimethyl ether.

10.1.1.2 Diethyl ether (Ethyl ether)

Common Name: Diethyl ether

Synonym: ether, ethyl ether, ethoxyethane, ethyl oxide, 3-oxapentane, 1,1'-oxybisethane, sulfuric ether

Chemical Name: ether, diethyl ether, ethoxyethane, ethyl oxide, 3-oxapentane, 1,1'-oxybisethane

CAS Registry No: 60-29-7

Molecular Formula: $C_4H_{10}O$, $CH_3CH_2OCH_2CH_3$

Molecular Weight: 74.121

Melting Point ($^{\circ}C$):

-116.2 (Lide 2003)

Boiling Point ($^{\circ}C$):

34.5 (Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.7136. 0.7078 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

103.9 ($20^{\circ}C$, calculated-density)

106.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

5.439 (quoted, Riddick et al. 1986)

7.19 (exptl., Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

60270* (thermostatic volumetric method, measured range -3.83 to $30^{\circ}C$, Hill 1923)

60400* (volumetric method, measured range 10 – $30^{\circ}C$, Kablukov & Malischeva 1925)

60300* (volumetric method, measured range 10 – $25^{\circ}C$, Bennett & Phillip 1928)

69000 (Seidell 1941; Lange 1971)

60400 (selected, Riddick et al. 1986)

60900 (literature data compilation, Yaws et al. 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

58335* ($19.871^{\circ}C$, manometer, measured range -60.799 – $19.871^{\circ}C$, Taylor & Smith)

74690* (calculated-Antoine eq. regression, temp range -74 to $35.6^{\circ}C$, Stull 1947)

323835* ($71.11^{\circ}C$, static method-Bourdon, measured range 71.11 – $187.78^{\circ}C$, Kobe et al. 1956)

$\log (P/mmHg) = [-0.2185 \times 6946.2/(T/K)] + 7.56659$; temp range -74.3 to $183.3^{\circ}C$ (Antoine eq., Weast 1972–73)

58920 ($20^{\circ}C$, Verschueren 1983)

63340* ($21.82^{\circ}C$, ebulliometry, measured range 250 – $467 K$, Ambrose et al. 1972; quoted, Boublik et al. 1984)

$\log (P/kPa) = 6.05115 - 1062.409/[(T/K) - 44.967]$; temp range 250 – $329 K$ (ebulliometry, Antoine eq., Ambrose et al. 1972)

71620 (Ambrose et al. 1976)

71240, 71610 (calculated-Antoine eq., Boublik et al. 1984)

$\log (P/kPa) = 6.04972 - 1066.052/(220.003 + t/^{\circ}C)$; temp range -70.0 to $19.87^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/kPa) = 6.0492 - 1061.391/(228.06 + t/^{\circ}C)$; temp range -23.1 to $55.434^{\circ}C$ (Antoine eq. from reported exptl. data of Ambrose et al. 1972, Boublik et al. 1984)

$\log (P/mmHg) = 6.92032 - 1064.07/(228.8 + t/^{\circ}C)$; temp range -61 to $20^{\circ}C$ (Antoine eq., Dean 1985, 1992)

71620 (selected, Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.05115 - 1062.409/(228.183 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
71620, 71604 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.02962 - 1051.432/(-44.967 + T/\text{K})$; temp range 286–329 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.05115 - 1062.409/(-44.967 + T/\text{K})$; temp range 250–329 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.30714 - 1236.75/(-20.11 + T/\text{K})$; temp range 307–457 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.05933 - 1067.576/(-44.217 + T/\text{K})$; temp range 305–360 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.37811 - 1276.822/(-14.869 + T/\text{K})$; temp range 417–467 K (Antoine eq.-V, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 41.7519 - 2.741 \times 10^3/(T/\text{K}) - 12.27 \cdot \log (T/\text{K}) - 3.1948 \times 10^{-10} \cdot (T/\text{K}) + 5.9802 \times 10^{-6} \cdot (T/\text{K})^2$;
temp range 157–467 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated and reported temperature dependence):

130 (calculated- $1/K_{\text{AW}}$, $C_{\text{W}}/C_{\text{A}}$, reported as exptl., Hine & Mookerjee 1975)

90.0 (calculated-group contribution method, Hine & Mookerjee 1975)

237 (calculated-bond contribution method, Hine & Mookerjee 1975)

87.9 (calculated-P/C using Riddick et al. 1986 data)

86.8 (23°C , batch air stripping-IR, Nielsen et al. 1994)

95.05 (20°C , selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)

$\log K_{\text{AW}} = 5.953 - 2158/(T/\text{K})$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

0.83 (20°C , shake flask-CR, Collander 1951)

1.03 (Hansch et al. 1968)

0.89 (shake flask-GC, both phases, Hansch et al. 1975)

0.77 (shake flask, Log P Database, Hansch & Leo 1987)

0.89 (recommended, Sangster 1989)

0.89 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$ at 25°C :

2.19 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{\text{OH}}(\text{calc}) = 1.43 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{obs.}) = 1.34 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{\text{OH}}^* = 13.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K, measured range 295–442 K (Tully & Droege 1987)

$k_{\text{OH}}(\text{exptl}) = 1.34 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{calc}) = 1.06 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{\text{OH}}^* = (13.6 \pm 0.9) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 240–440 K (flash photolysis-resonance fluorescence, Wallington et al. 1988b)

$k_{\text{OH}} = 1.36 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 6.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988a)

$k_{\text{OH}} = 1.20 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 294 K (relative rate method, Bennett & Keer 1989)

$k_{\text{OH}}^* = 1.33 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ 298 K (recommended, Atkinson 1989, 1990)

$k_{\text{OH}} = (11.3 \pm 0.10) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse radiolysis-UV spectroscopy; $k_{\text{OH}} = (12.8 \pm 0.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method, at $298 \pm 2 \text{ K}$ (Nelson et al. 1990)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24 \text{ h}$ from the air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

calculated lifetimes of 11 h and 17 d for reactions with OH radical, NO_3 radical, respectively (Atkinson 2000).

10.1.1.3 Methyl *t*-butyl ether (MTBE)

Common Name: Methyl *t*-butyl ether

Synonym: MTBE, 3-oxa-3,3-dimethylbutane, 2-methoxy-2-methyl-propane

Chemical Name: methyl *tert*-butyl ether

CAS Registry No: 1634-04-4

Molecular Formula: C₅H₁₂O, CH₃-O-C(CH₃)₃

Molecular Weight: 88.148

Melting Point (°C):

−108.6 (Lide 2003)

Boiling Point (°C):

55.0 (Lide 2003)

Density (g/cm³ at 20°C):

0.7578 (Bennett & Phillip 1928)

0.7404 (Windholz 1983; Budavari 1989)

Molar Volume (cm³/mol):

119.1 (20°C, calculated-density)

127.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

7.60 (exptl., Chickos et al. 1999)

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

51600* (thermostatic volumetric method, measured range 0–25°C, Bennett & Phillip 1928)

48000 (Windholz 1983; Budavari 1989)

52100 (literature data compilation, Yaws et al. 1990)

42000* (19.8°C, shake flask-GC/TC, measured range 0–48.6°C, Stephenson 1992)

62100, 35500 (5, 20°C, shake flask-GC, Fischer et al. 2004)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

31156* (23.243°C, comparative ebulliometry, measured range 288–351 K, Ambrose et al. 1976)

log (P/kPa) = 6.09379 – 1173.036/{(T/K) + 41.366}; temp range 288–351 K (Antoine equation, comparative ebulliometry, Ambrose et al. 1976)

32660 (Windholz 1983; Budavari 1989)

33545 (calculated-Antoine eq., Stephenson & Malanowski 1987)

log (P₁/kPa) = 6.09111 – 1171.54/(−41.542 + T/K); temp range 287–351 K (Antoine eq., Stephenson & Malanowski 1987)

37417* (27.806°C, static method, measured range 301–411 K, Krähenbühl & Gmehling 1994)

log (P/kPa) = 6.070343 – 1158.923/(T/K) – 43.20; temp range 301–411 K (Antoine eq., static method, Krähenbühl & Gmehling 1994)

log (P/mmHg) = 4.7409 – 1.9493 × 10³/(T/K) + 3.077 · log (T/K) – 1.4463 × 10^{−2} · (T/K) + 1.0039 × 10^{−5} · (T/K)²; temp range 165–497 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated and reported temperature dependence equation. Additional data at other temperatures designated * are compiled at the end of this section):

59.46 (calculated as 1/K_{AW}, C_W/C_A, reported as exptl., Hine & Mookerjee 1975)

142.6, 305 (calculated-group contribution, calculated-bond contribution method, Hine & Mookerjee 1975)

53.54*, 121 (25, 30°C, static headspace-GC, Robbins et al. 1993)

63.2 (EPICS-static headspace method-GC/FID, Miller & Stuart 2000)

137.6* (solid-phase microextraction-GC, measured range 15–40°C, Bierwagen & Keller 2001)

$\ln K_{AW} = 6.6475 - 2901.4/(T/K)$; temp range 15–40°C (SPME-GC, Bierwagen & Keller 2001)

41.2 (20°C, selected from literature experimentally measured data, Staudinger & Roberts 1996, 2001)

$\log K_{AW} = 9.070 - 3178/(T/K)$ (van't Hoff eq. derived from literature data, Staudinger & Roberts 2001)

72.4* (equilibrium concentration ratio-GC, measured range 3–25°C, Fischer et al. 2004)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.06 (Hansch et al. 1968; Kier & Hall 1976)

1.30 (calculated-fragment const., Hansch & Leo 1979)

0.94 (shake flask-GC, Funasaki et al. 1985)

0.94 (recommended, Sangster 1989)

0.94 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{OH}(\text{calc}) = 1.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 2.64 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{OH}(\text{exptl}) = 2.64 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 1.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}^* = (3.09 \pm 0.15) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K, measured range 240–440 K (flash photolysis-resonance fluorescence, Wallington et al. 1988c)

$k_{OH} = 3.09 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 2.7 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)

$k_{OH}^* = 2.83 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{OH} = (2.44 - 3.09) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295–298 K (Atkinson 1989)

$k_{OH}^* = 2.98 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 293 K, measured range 293–750 K (laser photolysis-laser induced fluorescence technique, Arif et al. 1997)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24 \text{ h}$ from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

calculated lifetimes of 3.9 d and 72 d for reactions with OH radical, NO_3 radical, respectively (Atkinson 2000).

10.1.1.4 Di-*n*-propyl ether

Common Name: Di-*n*-propyl ether

Synonym: 4-oxaheptane, 1,1'-oxibispropane, 1-propoxypropane, propyl ether

Chemical Name: di-*n*-propyl ether, propyl ether, 4-oxaheptane

CAS Registry No: 111-43-3

Molecular Formula: C₆H₁₄O, (*n*-C₃H₇)₂O

Molecular Weight: 102.174

Melting Point (°C):

−114.8 (Lide 2003)

Boiling Point (°C):

90.08 (Riddick et al. 1986; Lide 2003)

Density (g/cm³ at 20°C):

0.7466, 0.7419 (20°C, 25°C, Riddick et al. 1986)

Molar Volume (cm³/mol):

136.9 (20°C, calculated-density)

151.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

10.78 (quoted, Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

4900* (thermostatic volumetric method, measured range 0–25°C, Bennett & Phillip 1928)

2500* (synthetic method, measured range 0–25°C, Bennett & Phillip 1928)

3000 (Seidell 1941; Lange 1971)

2508 (selected, Hine & Mookerjee 1975)

4900 (selected, Riddick et al. 1986)

3820 (literature data compilation, Yaws et al. 1990)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

9072* (calculated-Antoine eq. regression, temp range −43.3 to 89.5°C, Stull 1947)

16358* (39.703°C, comparative ebulliometry, measured range 39.703–98.183°C, Meyer & Hotz 1973)

log (P/mmHg) = [−0.2185 × 8229.6/(T/K)] + 7.863332; temp range −43.3 to 89.5°C (Antoine eq., Weast 1972–73)

9041* (26.59°C, ebulliometry, measured range 26.59–88.65°C, Cidlinski & Polak 1969; quoted, Boublik et al. 1984)

log (P/cmHg) = 5.894812 − 1227.468/(215.7007 + t/°C); temp range 39.7–98.2°C (comparative ebulliometry, Meyer & Hotz 1973)

7621* (23.174°C, ebulliometry, measured range 292.974–387.883 K, Ambrose et al. 1976)

log (P/kPa) = 6.03075 − 1233.148/[(T/K) + 56.708]; temp range 293–388 K (Antoine eq., ebulliometry, Ambrose et al. 1976)

8378, 8320 (calculated-Antoine eq., Boublik et al. 1984)

log (P/kPa) = 6.06887 − 1254.429/(218.781 + t/°C); temp range 26.59–88.65°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

log (P/kPa) = 6.01902 − 1227.068/(215.654 + t/°C); temp range 39.7–86.18°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

log (P/mmHg) = 6.9476 − 1256.5/(219.0 + t/°C); temp range 26–89°C (Antoine eq., Dean 1985, 1992)

8334 (selected, Riddick et al. 1986)

log (P/kPa) = 6.03075 − 1133.748/(216.442 + t/°C), temp range not specified (Antoine eq., Riddick et al. 1986)

8334 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.019715 - 1227.468/(-57.449 + T/\text{K})$; temp range 312–371 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.0361 - 1236.828/(-56.358 + T/\text{K})$; temp range 292–389 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.50879 - 1579.466/(-12.142 + T/\text{K})$; temp range 385–467 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 8.20381 - 3494.323/(209.259 + T/\text{K})$; temp range 465–510 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 44.0232 - 3.282 \times 10^3/(T/\text{K}) - 12.792 \cdot \log (T/\text{K}) + 1.2682 \times 10^{-10} \cdot (T/\text{K}) + 4.8776 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 150–531 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

350.1 (calculated as $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

175.5, 594.6 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

223.3 (computer value, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.03 (shake flask, Hansch et al. 1968; Leo et al. 1971)

2.03 (recommended, Sangster 1989)

2.03 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C:

2.97 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{OH} = 1.68 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (relative rate, Lloyd et al. 1976)

$k_{OH}(\text{calc}) = 2.05 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 1.68 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{OH}(\text{calc}) = 1.57 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{exptl}) = 1.68 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}^* = (18.0 \pm 2.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 240–440 K (flash photolysis-resonance fluorescence, Wallington et al. 1988c)

$k_{OH} = 1.53 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 294 ± 2 K (relative rate method, Bennett & Kerr 1989)

$k_{OH}^* = 1.72 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{OH} = (19.9 \pm 1.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse radiolysis-UV spectroscopy; $k_{OH} = (20.3 \pm 1.8) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method, at 298 ± 2 K (Nelson et al. 1990)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24$ h from air) for the reaction with OH radical (Darnall et al. 1976).

10.1.1.5 Di-isopropyl ether

Common Name: Di-isopropyl ether

Synonym: diisopropoxyde, isopropyl ether, 2-isopropoxypropane, 2,2'-oxybispropane, 3-oxa-2,4-dimethylpentane, IPE, DIPE

Chemical Name: diisopropyl ether, isopropyl ether, 2-isopropoxypropane, 2,2'-oxybispropane, 3-oxa-2,4-dimethylpentane

CAS Registry No: 108-20-3

Molecular Formula: $C_6H_{14}O$, $[(CH_3)_2CH]_2O$

Molecular Weight: 102.174

Melting Point ($^{\circ}C$):

−85.4 (Lide 2003)

Boiling Point ($^{\circ}C$):

68.4 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.7360 (Bennett & Phillip 1928)

0.7239, 0.7185 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

140.0 ($20^{\circ}C$, calculated-density)

151.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

12.033 (quoted, Riddick et al. 1986)

12.05 (exptl., Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

2040 (selected, Hine & Mookerjee 1975)

9000 ($20^{\circ}C$, Verschueren 1983)

12000 ($20^{\circ}C$, selected, Riddick et al. 1986)

11200 (literature data compilation, Yaws et al. 1990)

7900*, 5400 ($20^{\circ}C$, $31^{\circ}C$, shake flask-GC/TC, measured range 0 – $61^{\circ}C$. Stephenson 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

21410* (calculated-Antoine eq. regression, temp range -57 to $67.5^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.09712 - 1257.6/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

20093* (temp range 0 – $60^{\circ}C$, Nicolini & Laffitte 1949)

21532* ($26.8^{\circ}C$, ebulliometry, measured range 13.5 – $70.6^{\circ}C$, Flom et al. 1951)

20194* ($25.29^{\circ}C$, ebulliometry, measured range 23.5 – $67.21^{\circ}C$, Cidlinsky & Polak 1969; quoted, Boublik et al. 1984)

$\log(P/mmHg) = [-0.2185 \times 7777.3/(T/K)] + 7.904664$; temp range -57 to $67.5^{\circ}C$ (Antoine eq., Weast 1972–73)

17778* ($22.489^{\circ}C$, ebulliometry, measured 284.779 – $365.122\ K$, Ambrose et al. 1976)

$\log(P/kPa) = 5.97678 - 1143.073/\{(T/K) + 53.810\}$; temp range 284 – $365\ K$ (Antoine eq., ebulliometry, Ambrose et al. 1976)

19954, 20120 (calculated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 5.78384 - 1050.657/(209.511 + t/^{\circ}C)$; temp range 0 – $60^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/kPa) = 5.97081 - 1137.408/(218.516 + t/^{\circ}C)$; temp range 23.5 – $67.21^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/mmHg) = 6.8495 - 1139.34/(218.7 + t/^{\circ}C)$; temp range 23 – $67^{\circ}C$ (Antoine eq., Dean 1985, 1992)

19880 (selected, Riddick et al. 1986)

$\log(P/\text{kPa}) = 5.97678 - 1143.073/(219.340 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
19950, 19890 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 5.966496 - 1135.034/(-54.92 + T/\text{K})$; temp range 296–342 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 5.97661 - 1142.985/(-53.82 + T/\text{K})$; temp range 284–365 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 6.26597 - 1334.298/(-28.271 + T/\text{K})$; temp range 360–440 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log(P_L/\text{kPa}) = 7.13537 - 2140.415/(80.78 + T/\text{K})$; temp range 436–500 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

19862, 10850 (quoted, calculated-solvatochromic parameters and UNIFAC, Banerjee et al. 1990)

$\log(P/\text{mmHg}) = 35.9552 - 2.0276 \times 10^3/(T/\text{K}) - 2.8551 \cdot \log(T/\text{K}) + 2.7662 \times 10^{-4} \cdot (T/\text{K}) - 9.9111 \times 10^{-14} \cdot (T/\text{K})^2$;
temp range 188–500 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated):

1010 (calculated as $1/K_{\text{AW}}, C_{\text{W}}/C_{\text{A}}$, reported as exptl., Hine & Mookerjee 1975)

483.3, 594.6 (calculated-group contribution calculated-bond contribution, Hine & Mookerjee 1975)

175.6 (computer value, Yaws et al. 1991)

208.8 (23°C , batch air stripping-IR, Nielsen et al. 1994)

212.4 (exponential saturator EXPSAT technique, Dohnal & Hovorka 1999)

231 (EPICS-static headspace method-GC/FID, Miller & Stuart 2000)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

1.52 (shake flask-GC, Funasaki et al. 1985)

1.56 (calculated-fragment const., Hansch & Leo 1979)

1.52 (recommended, Sangster 1989)

1.52 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{\text{OA}}$:

2.66 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k_{\text{OH}} = (1.07 \pm 0.20) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse radiolysis-UV spectroscopy, $k_{\text{OH}} = (1.13 \pm 0.20) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ by relative rate technique (Nelson et al. 1990)

$k_{\text{OH}}^* = (1.08 \pm 0.09) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K, measured range 240–400 K (absolute rate, flash photolysis-resonance fluorescence, Wallington et al. 1993)

$k_{\text{OH}} = (9.9 \pm 0.2) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ and $(1.07 \pm 0.6 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1})$ at 298 K (relative rate method, Wallington et al. 1993)

$k_{\text{OH}} = 9.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K using both relative (at 295 K) and absolute techniques over 240–440 K (FT-IR spectroscopy, Wallington et al. 1993)

$k_{\text{OH}} = 2.2 \times 10^{-12} \exp[(445 \pm 1450)/(T/\text{K})]$; temp range 240–440 K (Arrhenius eq., FT-IR, Wallington et al. 1993)

$k_{\text{OH}}(\text{calc}) = 33.3 \times 10^{-12} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, $k_{\text{OH}}(\text{exptl}) = 10.2 \times 10^{-12} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ at 298 K (SAR structure-activity relationship, Kwok & Atkinson 1995)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976).

10.1.1.6 Butyl ethyl ether

Common Name: Butyl ethyl ether

Synonym: butyl ethyl ether, 1-ethoxybutane, *n*-butylethyl ether, 3-oxaheptane

Chemical Name: butylethyl ether, 1-ethoxybutane, *n*-butylethyl ether

CAS Registry No: 628-81-9

Molecular Formula: $C_6H_{14}O$, $C_4H_9OCH_2CH_3$

Molecular Weight: 102.174

Melting Point ($^{\circ}C$):

-124 (Lide 2003)

Boiling Point ($^{\circ}C$):

92.3 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.7495, 0.7448 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

136.3 ($20^{\circ}C$, calculated-density)

150.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

6500* ($20^{\circ}C$, shake flask-GC/TC, measured range 0 – $90.7^{\circ}C$, Stephenson 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

303164* ($126.67^{\circ}C$, static-Bourdon gauge, measured range 126.67 – $237.78^{\circ}C$, Kobe et al. 1956)

13912* ($38.18^{\circ}C$, ebulliometry, measured range 38.18 – $91.38^{\circ}C$, Cidlinsky & Polak 1969; quoted, Boublik et al. 1984)

$\log(P/kPa) = 6.06257 - 1252.485/(T/K + 56.685)$ (Antoine eq., Ambrose et al. 1976)

9090 (calculated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.06565 - 1234.258/(226.668 + t/^{\circ}C)$; temp range 38.18 – $91.38^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/mmHg) = 6.9444 - 1256.4/(216.9 + t/^{\circ}C)$; temp range 38 – $92^{\circ}C$ (Antoine eq., Dean 1985, 1992)

7461 (quoted, Riddick et al. 1986)

$\log(P/kPa) = 6.06257 - 1252.485/(216.465 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

7510 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.062575 - 1252.485/(-56.685 + T/K)$; temp range 311 – $365 K$ (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 8.5224 - 2.4667 \times 10^3/(T/K) + 1.0513 \cdot \log(T/K) - 1.4047 \times 10^{-2} \cdot (T/K) + 9.2664 \times 10^{-6} \cdot (T/K)^2$; temp range 170 – $531 K$ (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$):

136 (calculated-P/C from selected data)

241 (EPICS-static headspace method-GC/FID, Miller & Stuart 2000)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.03 (shake flask-GC, Hansch & Anderson 1967)

2.03 (recommended, Sangster 1989)

2.03 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.89 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = 2.28 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (flash photolysis-resonance fluorescence, Wallington et al. 1988c)

$k_{OH} = 1.34 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $294 \pm 2 \text{ K}$ (relative rate, Bennett & Kerr 1989)

$k_{OH} = (13.4 - 22.8) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 294–298 K (review, Atkinson 1989)

$k_{OH} = (18.7 \pm 0.7) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ (pulse radiolysis-UV spectroscopy, Nelson et al. 1990)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24 \text{ h}$ from air for the reaction with OH radical (US EPA 1974; quoted, Darnall et al. 1976).

10.1.1.7 Di-*n*-butyl ether

Common Name: Di-*n*-butyl ether

Synonym: 1-butoxybutane, butyl ether, dibutyl ether, *n*-butyl ether, 5-oxanonane, 1,1'-oxybisbutane

Chemical Name: butyl ether, dibutyl ether, di-*n*-butyl ether, *n*-butyl ether, 5-oxanonane, 1,1'-oxybisbutane

CAS Registry No: 142-96-1

Molecular Formula: C₈H₁₈O, (n-C₄H₉)₂O

Molecular Weight: 130.228

Melting Point (°C):

−95.2 (Riddick et al. 1986; Lide 2003)

Boiling Point (°C):

140.28 (Lide 2003)

Density (g/cm³ at 20°C):

0.76889, 0.76461 (20°C, 25°C, Dreisbach & Martin 1949)

0.7684, 0.7641 (20°C, 25°C, Riddick et al. 1986)

Molar Volume (cm³/mol):

170.0 (calculated-density, Wang et al. 1992)

196.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

< 100 (17°C, synthetic method, Bennett & Phillip 1928)

300 (20°C, Verschueren 1983; Riddick et al. 1986)

230* (19.9°C, shake flask-GC/TC, measured range 0–90.6°C, Stephenson 1992)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

7605* (66.84°C, ebulliometry, measured range 67–142°C, Dreisbach & Shrader 1949)

log (P/mmHg) = 7.31540 – 1648.4/(230 + t/°C) (Antoine eq., Dreisbach & Martin 1949)

80612* (237.78°C, static method-Bourdon gauge, measured range 238–293°C, Kobe et al. 1956)

19529* (89.14°C, ebulliometry, measured range 89.14–140°C, Cidlinsky & Polak 1969)

log (P/kPa) = 5.93018 – 1302.768/(T/K – 81.481); temp range 89–140°C (Cidlinsky & Polak 1969)

log (P/kPa) = 5.93018 – 1302.768/{(T/K) – 81.481} (Antoine eq., ebulliometry, Ambrose et al. 1976)

640 (20°C, Verschueren 1983)

825, 874 (calculated-Antoine eq., Boublik et al. 1984)

log (P/kPa) = 6.151 – 1458.718/(141.982 + t/°C); temp range 66.8–141.97°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

log (P/kPa) = 5.92274 – 1298.256/(191.144 + t/°C); temp range 89.14–140.06°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

log (P/mmHg) = 6.7963 – 1297.3/(191.03 + t/°C); temp range 89–140°C (Antoine eq., Dean 1985, 1992)

898 (select, Riddick et al. 1986)

log (P/kPa) = 5.930185 – 1302.768/(191.669 + t/°C), temp range not specified (Antoine eq., Riddick et al. 1986)

log (P_L/kPa) = 6.4403 – 1648.4/(–42.15 + T/K); temp range 339–415 K (Antoine eq.-I, Stephenson & Malanowski 1987)

log (P_L/kPa) = 6.0537 – 1398.8/(–69.55 + T/K); temp range 336–415 K (Antoine eq., Stephenson & Malanowski 1987)

log (P/mmHg) = 12.9321 – 3.0416 × 10³/(T/K) + 0.42929 · log (T/K) – 1.237 × 10^{–2} · (T/K) + 7.5943 × 10^{–6} · (T/K)²; temp range 178–581 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m³/mol at 25°C):

- 608.5 (calculated-1/K_{AW}, C_W/C_A, reported as exptl., Hine & Mookerjee 1975)
 350, 1362 (calculated-group contribution calculated-bond contribution, Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, log K_{OW}:

- 3.08 (calculated-f const., Hansch & Leo 1979)
 3.21 (shake flask-GC, Funasaki et al. 1984)
 3.21 (recommended, Sangster 1989)
 3.21 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, log K_{OA}:

- 3.89 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC}:

Environmental Fate Rate Constants, k, and Half-Lives, t_{1/2}:

Volatilization:

Photolysis:

Oxidation: rate constant k, for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO₃} with NO₃ radical and k_{O₃} with O₃ or as indicated, *data at other temperatures see reference:

k_{OH} = (27.8 ± 3.6) × 10⁻¹² cm³ molecule⁻¹ s⁻¹ at 296 K (flash photolysis-resonance fluorescence, Wallington et al. 1988a)

k_{OH} = 17 × 10⁻¹² cm³ molecule⁻¹ s⁻¹ at 294 ± 2 K (relative rate method, Bennett & Kerr 1989)

k_{OH} = (17.0 – 27.8) × 10⁻¹² cm³ molecule⁻¹ s⁻¹ at 294–298 K (review, Atkinson 1989)

k_{OH} = (27.2 ± 0.2) × 10⁻¹² cm³ molecule⁻¹ s⁻¹ by pulse radiolysis-UV spectroscopy; k_{OH} = (28.8 ± 1.2) × 10⁻¹² cm³ molecule⁻¹ s⁻¹ by relative rate method, at 298 ± 2 K (Nelson et al. 1990)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k₁) and Elimination (k₂) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance t_{1/2} < 0.24 h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976).

10.1.1.8 1,2-Propylene oxide

Common Name: 1,2-Propylene oxide

Synonym: 1,2-epoxypropane, methyloxirane, propylene oxide

Chemical Name: 1,2-propylene oxide, 1,2-epoxypropane, propylene oxide

CAS Registry No: 75-56-9

Molecular Formula: C₃H₆O

Molecular Weight: 58.079

Melting Point (°C):

–111.9 (Lide 2003)

Boiling Point (°C):

35 (Lide 2003)

Density (g/cm³ at 20°C):

0.859 (0°C, Verschueren 1983)

Molar Volume (cm³/mol):

69.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

6.57, 6.53 (exptl., Chickos et al. 1999)

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated):

476000 (US EPA 1981; quoted, Howard 1989)

405000, 650000 (20°C, 30°C, Verschueren 1983)

259000 (literature data compilation, Yaws et al. 1990)

139320 (calculated-group contribution method, Kühne et al. 1995)

Vapor Pressure (Pa at 25°C and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

74520* (calculated-Antoine eq. regression, temp range –75 to 34.5°C, Stull 1947)

530538* (87.78°C, static method, measured range 88–204°C, Kobe et al. 1956)

51969* (17.05°C, ebulliometry, measured range –24.17 to 34.75°C (McDonald et al. 1959)

$\log (P/\text{mmHg}) = 6.96997 - 1065.27/(226.283 + t/^{\circ}\text{C})$; temp range –24.17 to 34.75°C (ebulliometry, McDonald et al. 1959)

70112* (interpolated-Antoine eq., static method, measured range 19.0–71.8°C Bott & Sadler 1966)

$\log (P/\text{mmHg}) = 7.658 - 1472/(T/\text{K})$; temp range 19.0–71.8°C (Antoine eq., static method, Bott & Sadler 1966)

$\log (P/\text{mmHg}) = [-0.2185 \times 7295.8/(T/\text{K})] + 8.093473$; temp range –75 to 34.5°C (Antoine eq., Weast 1972–73)

$\log (P/\text{mmHg}) = 7.06492 - 1113.6/(232.0 + t/^{\circ}\text{C})$; temp range –35 to 130°C (Antoine eq., Dean 1985, 1992)

59300, 75900 (20, 25°C, Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.09487 - 1065.27/(226.283 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)

71700 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.09487 - 1065.27/(-46.867 + T/\text{K})$; temp range 225–308 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 38.5381 - 2.631 \times 10^3/(T/\text{K}) - 11.104 \cdot \log (T/\text{K}) + 4.2178 \times 10^{-10} \cdot (T/\text{K}) + 5.5025 \times 10^{-6} \cdot (T/\text{K})^2$; temp range 161–482 K (vapor pressure eq., Yaws 1994)

$\log (P/\text{kPa}) = 6.14068 - 1086.37/[(T/\text{K}) - 44.556]$; temp range not specified (Antoine eq., Horstmann et al. 2004)

Henry's Law Constant (Pa m³/mol at 25°C):

8.653 (calculated-P/C, Howard 1989)

Octanol/Water Partition Coefficient, $\log K_{\text{ow}}$:

0.03 (shake flask, Hansch & Leo 1985, 1987)

0.03	(recommended, Sangster 1989)
0.03	(recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

−0.20, −0.40 (calculated, Howard 1989)

Sorption Partition Coefficient, log K_{OC} :

0.623	(estimated-S, Lyman et al. 1982; quoted, Howard 1989)
1.477	(calculated-QSAR, Sabljic 1984; quoted, Howard 1989)

Environmental Fate Rate Constants, k , and Half-Lives,:

Volatilization: $t_{1/2}(\text{calc}) \sim 3$ and 18 d from a representative or natural river and oligotrophic lake, respectively (USEPA 1986; quoted, Howard 1989).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH}(\text{exptl}) = 5.2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 4.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for gas phase reactions;
 $k = 2.4 \times 10^8 \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ for the reaction with photochemically produced OH radical in water at room temp. (Güesten et al. 1981; quoted, Howard 1989)

photooxidation $t_{1/2} = 19.3$ d can be calculated for the gas phase reaction with OH radical in air by using Güesten 1981 data and assuming an average OH radical concn. of 8×10^5 molecules/cm³ (GEMS 1986; quoted, Howard 1989)

$k_{OH} = (1.11 \pm 0.75) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with reference to *n*-butane for the gas phase reaction with OH radical in air at $(23.1 \pm 1.1)^\circ\text{C}$ with an atmospheric lifetime of 10 d for an average concentration of 1×10^6 molecules/cm³ of OH radical (Edney et al. 1986)

$k_{OH}(\text{calc}) = 5.4 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k_{OH}(\text{exptl}) = 5.2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987)

$k_{OH} = (4.95 \pm 0.52) \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (flash photolysis-resonance fluorescence, Wallington et al. 1988a)

$k_{OH} = 4.95 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $k(\text{soln}) = 4.2 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for reaction with OH radical in aqueous solution (Wallington et al. 1988b)

Hydrolysis: estimated $t_{1/2} \sim 11.6$ d in fresh water at pH 7 to 9 and $t_{1/2} = 6.6$ d at pH 5 (Howard 1989).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

atmospheric lifetime of 10 d (Edney et al. 1986);

$t_{1/2} = 19.3$ d, based on estimated photooxidation half-life in air by using Güesten et al. 1981 data and assuming an average OH radical concn. of 8×10^5 molecules/cm³ (GEMS 1986; quoted, Howard 1989).

Surface water: calculated $t_{1/2} = 9.15$ yr in natural water by using Güesten et al. 1981 data and assuming an average OH radical concentration of 1×10^{-17} M in natural water (Howard 1989).

10.1.1.9 Furan

Common Name: Furan

Synonym: 1,4-epoxy-1,3-butadiene, divinylene oxide, furfuran, oxole, tetrole

Chemical Name: 1,4-epoxy-1,3-butadiene, divinylene oxide, furan

CAS Registry No: 110-00-9

Molecular Formula: C_4H_4O

Molecular Weight: 68.074

Melting Point ($^{\circ}C$):

−85.61 (Lide 2003)

Boiling Point ($^{\circ}C$):

31.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9378 (Dreisbach 1955; Riddick et al. 1986)

0.9514 (Weast 1982–83)

Molar Volume (cm^3/mol):

72.6 ($20^{\circ}C$, calculated-density)

73.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

3.803 (Riddick et al. 1986)

2.05, 3.80 (exptl., Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

10070 (literature average, Valvani et al. 1981)

10000 (Verschueren 1983)

10000 (Riddick et al. 1986)

9900 (literature data compilation, Yaws et al. 1990)

26500 (calculated-group contribution method, Kühne et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

70109* ($21.614^{\circ}C$, comparative ebulliometry, measured range $2,552$ – $61.43^{\circ}C$, Guthrie et al. 1952)

$\log(P/mmHg) = 6.97523 - 1060.851/(t/^{\circ}C + 227.740)$; temp range 2.5 – $61.43^{\circ}C$ (Antoine eq., comparative ebulliometry, Guthrie et al. 1952)

79980 (calculated from determined data, Dreisbach 1955)

$\log(P/mmHg) = 6.97523 - 1060.851/(227.740 + t/^{\circ}C)$; temp range -35 to $90^{\circ}C$ (Antoine eq. for liquid state, Dreisbach 1955)

627000* ($93.33^{\circ}C$, static-Bourdon gauge, measured range 93.33 – $210^{\circ}C$, Kobe et al. 1956)

$\log(P/mmHg) = [1 - 304.367/(T/K)] \times 10^4 \{0.858337 - 8.56435 \times 10^{-4} \cdot (T/K) + 9.32123 \times 10^{-7} \cdot (T/K)^2\}$; temp range 340.95 – $463.65\ K$ (Cox eq., Chao et al. 1983)

70110 ($21.61^{\circ}C$, quoted, Boublik et al. 1984)

79930 (calculated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 6.10017 - 1060.871/(227.742 + t/^{\circ}C)$; temp range: $2,552$ – $61.43^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log(P/mmHg) = 6.97527 - 1060.87/(227.74 + t/^{\circ}C)$; temp range: 2 – $61^{\circ}C$ (Antoine eq., Dean 1985, 1992)

84530 (selected, Riddick et al. 1986)

$\log(P/kPa) = 6.10013 - 1060.851/(227.74 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

79930 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.10013 - 1060.851/(-45.41 + T/K)$; temp range 238 – $363\ K$ (Antoine eq., Stephenson & Malanowski 1987)

$$\log (P/\text{mmHg}) = 24.9555 - 2.1624 \times 10^3/(T/K) - 6.1066 \cdot \log (T/K) - 2.4185 \times 10^{-10} \cdot (T/K) + 2.0858 \times 10^{-6} \cdot (T/K)^2;$$

temp range 188–490 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

575.5	(calculated-P/C using Riddick et al. 1986 data)
545.8	(computed-vapor liquid equilibrium (VLE) data, Yaws et al. 1991)

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

1.34	(Hansch & Leo 1979;)
1.13	(estimated-HPLC, Garst 1984)
1.14, 1.35	(estimated-MO, π substituent consts., Bodor et al. 1989)
1.34	(recommended, Sangster 1989)
1.34	(recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

1.50, 1.46; 1.48 (Captina silt loam, McLaurin sandy loam; weighted mean, batch equilibrium-sorption isotherm, Walton et al. 1992)

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures and/or the Arrhenius expression see reference:

$k = 1.4 \times 10^8 \text{ M}^{-1} \text{ s}^{-1}$ oxidation rate by singlet oxygen in water (Mill 1980; quoted, Mill & Mabey 1985)

$k_{\text{OH}} = (4.01 \pm 0.30) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a atmospheric lifetime $\tau \sim 7 \text{ h}$, $k_{\text{O}_3} = (2.42 \pm 0.28) \times 10^{-18} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$; and $k_{\text{O}(^3\text{P})} \sim 1.0 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the reaction with $\text{O}(^3\text{P})$ atom at 298 K (relative rate method, Atkinson et al. 1983)

$k_{\text{OH}} = (3.98 \pm 0.35) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $22 \pm 2^\circ\text{C}$ (relative rate method, Tuazon et al. 1984)

$k_{\text{OH}}^* = (40.8, 43.1) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 297 K , measured range $254\text{--}424 \text{ K}$ (FP-RF flash photolysis-resonance fluorescence, Wine & Thompson 1984)

$k_{\text{O}_3} = 2.4 \times 10^{-18} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of 0.15 d^{-1} , $k_{\text{OH}} = 4.0 \times 10^{-1} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of 3.5 d^{-1} , and $k_{\text{NO}_3} = 1.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of 29 d^{-1} at room temp. (review, Atkinson & Carter 1984)

$k_{\text{O}_3} = 2.4 \times 10^{-18} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of 0.15 d^{-1} , $k_{\text{OH}} = 4.0 \times 10^{-1} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of 1.7 d^{-1} , and $k_{\text{NO}_3} = 1.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a loss rate of 29 d^{-1} at room temp. (review, Atkinson 1985)

$k_{\text{NO}_3} = (1.4 \pm 0.2) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $295 \pm 2 \text{ K}$ (relative rate method, Atkinson et al. 1985)

$k_{\text{O}_3} = 2.4 \times 10^{-18} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated tropospheric lifetime $\tau = 6.7 \text{ d}$, $k_{\text{OH}} = 4.0 \times 10^{-1} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated $\tau = 6.9 \text{ h}$, and $k_{\text{NO}_3} = 1.4 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with a calculated $\tau = 50 \text{ min}$ at room temp. (Atkinson et al. 1985)

$k_{\text{OH}} = 4.07 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (Atkinson 1987, 1988; quoted, Müller & Klein 1991)

$k_{\text{OH}} = 4.046 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K , $k_{\text{NO}_3} = 1.439 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 295 K (Atkinson 1986 and Atkinson et al. 1988, Sabljic & Güsten 1990; Atkinson 1991)

$k_{\text{NO}_3} = 1.44 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (relative rate method, Atkinson et al. 1988, Atkinson 1991)

$k_{\text{OH}}^* = 4.05 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

calculated atmospheric lifetimes: 6.7 d due to reaction with O_3 in 24-h, 6.9 h due to reaction with OH radical in daytime and 50 min with NO_3 radical at room temp. (Atkinson et al. 1985).

Surface water: $t_{1/2} = 1.0$ h, estimated from oxidation rate by singlet oxygen of $1.4 \times 10^8 \text{ M}^{-1} \text{ s}^{-1}$ (Mill 1980; quoted, Mill & Mabey 1985).

10.1.1.10 2-Methylfuran

Common Name: 2-Methylfuran

Synonym: silvan, sylvan

Chemical Name: 2-methylfuran

CAS Registry No: 534-22-5

Molecular Formula: C₅H₆O

Molecular Weight: 82.101

Melting Point (°C):

−91.3 (Lide 2003)

Boiling Point (°C):

64.7 (Lide 2003)

Density (g/cm³ at 20°C):

0.913 (Verschuereen 1983)

Molar Volume (cm³/mol):

89.9 (20°C, calculated-density)

95.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

8.66 (exptl., Chickos et al. 1999)

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

3000 (20°C, Verschuereen 1983)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

358285* (110°C, static-Bourdon gauge, measured range 110–254.44°C, Kobe et al. 1956)

86126* (60.3°C, isotenoscope/manometry, measured range 60.3–100.3°C, Eon et al. 1971)

$\log (P/\text{mmHg}) = [1 - 338.704/(T/K)] \times 10^{\{0.871223 - 7.95690 \times 10^{-4} \cdot (T/K) + 7.81737 \times 10^{-7} \cdot (T/K)^2\}}$; temp range 333.45–527.61 K (Cox eq., Chao et al. 1983)

18930, 29990 (20°C, 30°C, quoted, Verschuereen 1983)

23090 (calculated-Antoine eq., Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.81244 - 1641.052/(276.164 + t/^\circ\text{C})$; temp range 60.3–100.3°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

23250 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 5.95585 - 1107.3/(-56.88 + T/K)$; temp range 251–338 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m³/mol at 25°C or as indicated):

518 (20°C, calculated-P/C using Verschuereen 1983 data)

Octanol/Water Partition Coefficient, log K_{ow}:

1.85 (shake flask, Log P Database, Hansch & Leo 1987)

1.85 (recommended, Sangster 1989)

1.85 (recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24$ h from air for the reaction with OH radical (Darnall et al. 1976).

10.1.1.11 Tetrahydrofuran

Common Name: Tetrahydrofuran

Synonym: 1,4-epoxybutane, diethylene oxide, oxacyclopentane, tetramethylene oxide

Chemical Name: 1,4-epoxybutane, diethylene oxide, oxacyclopentane, tetrahydrofuran, tetramethylene oxide

CAS Registry No: 109-99-9

Molecular Formula: C₄H₈O

Molecular Weight: 72.106

Melting Point (°C):

−108.44 (Lide 2003)

Boiling Point (°C):

65 (Lide 2003)

Density (g/cm³ at 20°C):

0.8880 (Verschuereen 1983)

0.8892 (Riddick et al. 1986)

Molar Volume (cm³/mol):

81.1 (20°C, calculated-density)

88.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

8.535 (quoted, Riddick et al. 1986)

8.54 (exptl., Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C):

miscible (Verschuereen 1983; Riddick et al. 1986)

Vapor Pressure (Pa at 25°C or as indicated and reported temperature dependence equations Additional data at other temperatures designated * are compiled at the end of this section):

23465* (dynamic-ebulliometry, measured 15–65°C, Flom et al. 1951)

434076* (121.11°C, static-Bourdon gauge, measured range 121.11–265.56°C, Kobe et al. 1956)

19920* (23.139°C, measured range 23.2–99.7°C, Scott et al. 1970)

21646* (measured range 0.35–35°C, Koizumi & Ouchi 1970; quoted, Boublik et al. 1984)

$\log (P/\text{mmHg}) = [1 - 339.244/(T/K)] \times 10^4 \{0.830424 - 6.81525 \times 10^{-4} \cdot (T/K) + 6.84786 \times 10^{-7} \cdot (T/K)^2\}$; temp range 253.15–540.15 K (Cox eq., Chao et al. 1983)

17530, 26340 (20°C, 30°C, quoted, Verschuereen 1983)

21610, 21630 (calculated-Antoine eq., Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.59372 - 1446.15/(249.982 + t/^\circ\text{C})$; temp range 0.35–35°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.12023 - 1202.394/(226.267 + t/^\circ\text{C})$; temp range 23.139–99.7°C (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{mmHg}) = 6.97231 - 540.5/(260.10 + t/^\circ\text{C})$; temp range not specified (Antoine eq., Dean 1985, 1992)

19920, 21600, 26870 (23.139, 25, 30°C, Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.79696 - 1157.06/(t/^\circ\text{C} + 206.75)$, temp range: 90–140°C, (Antoine eq., Riddick et al. 1986)

21620, 21900 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 5.92617 - 1101.47/(-57/95 + T/K)$; temp range 273–339 K (Antoine eq.-I, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.12052 - 1202.561/(-46.863 + T/K)$; temp range 296–373 K (Antoine eq.-II, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.63507 - 1626.656/(15.041 + T/K)$; temp range 399–479 K (Antoine eq.-III, Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.73137 - 1702.922/(23.613 + T/\text{K})$; temp range 467–541 K (Antoine eq.-IV, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = 34.870 - 2.7523 \times 10^3/(T/\text{K}) - 9.5958 \cdot \log (T/\text{K}) + 1.9889 \times 10^{-10} \cdot (T/\text{K}) + 3.5465 \times 10^{-6} \cdot (T/\text{K})^2$;
temp range 165–540 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

7.15 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

10.33, 142.6 (calculated-group contribution calculated-bond contribution method, Hine & Mookerjee 1975)

Octanol Water Partition Coefficient, $\log K_{OW}$:

0.46 (calculated-f const., Hansch & Leo 1979)

0.22 (shake flask-GC, Funasaki et al. 1985)

0.46 (shake flask, Log P Database, Hansch & Leo 1987)

0.46 (recommended, Sangster 1989)

0.46 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

2.86 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{OC}$:

1.37, 1.26; 1.33 (Captina silt loam, McLaurin sandy loam; weighted mean, batch equilibrium-sorption isotherm, Walton et al. 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (1.59 - 1.63) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (FP-RF flash photolysis-resonance fluorescence, Ravishankara & Davis 1978)

$k_{OH}(\text{calc}) = 1.66 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 1.5 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987)

$k_{OH}(\text{exptl}) = 1.50 \times 10^{-11} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 1.28 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (Atkinson 1986, 1987; quoted, Sabljic & Güsten 1990)

$k_{OH}(\text{calc}) = 1.28 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1987, 1988; quoted, Müller & Klein 1991)

$k_{NO_3} = 4.875 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $296 \pm 2 \text{ K}$ (Atkinson et al. 1988; quoted, Sabljic & Güsten 1990; Atkinson 1991)

$k_{NO_3} = 4.88 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (relative rate method, Atkinson et al. 1988, Atkinson 1991)

$k_{OH} = 1.78 \times 10^{-11} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at 296 K (RP-RF method, Wallington et al. 1988b)

$k_{OH} = 1.61 \times 10^{-11} \text{ cm}^3 \cdot \text{molecule}^{-1} \text{ s}^{-1}$ at 298 K (recommended, Atkinson 1989)

$k_{OH}^* = 18.0 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method; $k_{OH} = 16.7 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse laser photolysis-laser induced fluorescence and atmospheric lifetime calculated to be 16 h at $298 \pm 2 \text{ K}$; measured range 263–372 K (Moriarty et al. 2003)

FIGURE 10.1.1.11.1 Logarithm of vapor pressure versus reciprocal temperature for tetrahydrofuran.

10.1.1.12 Tetrahydropyran

Common Name: Tetrahydropyran

Synonym: pentamethylene oxide, oxacyclohexane

Chemical Name: 1,5-epoxypentane, pentamethylene oxide, oxacyclohexane, tetrahydro-2H-pyran

CAS Registry No: 142-68-7

Molecular Formula: $C_5H_{10}O$

Molecular Weight: 86.132

Melting Point ($^{\circ}C$):

−49.1 (Lide 2003)

Boiling Point ($^{\circ}C$):

88.0 (Riddick et al. 1986; Stephenson & Malanowski 1987; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.8814, 0.8772 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

97.7 ($20^{\circ}C$, calculated-density)

107.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

80200 (selected, Riddick et al. 1986)

85700*, 68800 ($19.9^{\circ}C$, $31^{\circ}C$, shake flask-GC/TC, measured range $0-81.3^{\circ}C$, Stephenson 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

9536 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.01171 - 1249.062/(-49.943 + T/K)$; temp range $273-362 K$ (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$):

12.71 (calculated- $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975)

13.94, 215.9 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

0.64 (shake flask-GC, Funasaki et al. 1985)

0.82 (recommended, Sangster 1989)

1.00 (recommended, Sangster 1993)

0.95 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.22 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{\text{OH}} \sim 13.8 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ for the gas-phase reactions with OH radical at 298 K (Atkinson 1989)
 $k_{\text{OH}}^* = 11.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method; $k_{\text{OH}} = 12.3 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse laser photolysis-laser induced fluorescence and atmospheric lifetime calculated to be 28 h at $298 \pm 2 \text{ K}$, measured range 263–372 K (Moriarty et al. 2003).

Hydrolysis:

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24 \text{ h}$ from air for the reaction with OH radical (Darnall et al. 1976);
 photodecomposition $t_{1/2} = 3.4 \text{ h}$ under simulated atmospheric conditions, with NO (Dilling et al. 1976).

10.1.1.13 1,4-Dioxane

Common Name: 1,4-Dioxane

Synonym: 1,4-diethylenedioxiide, glycoethyleneether, *p*-dioxane

Chemical Name: 1,4-dioxane

CAS Registry No: 123-91-1

Molecular Formula: $C_4H_8O_2$

Molecular Weight: 88.106

Melting Point ($^{\circ}C$):

11.85 (Lide 2003)

Boiling Point ($^{\circ}C$):

101.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.03318, 1.02766 ($20^{\circ}C$, $25^{\circ}C$, Hovorka et al. 1936)

1.0336, 1.0280 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

85.2 ($20^{\circ}C$, calculated-density)

92.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

12.46 (quoted, Riddick et al. 1986)

12.84 (exptl., Chickos et al. 1999)

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

miscible (Verschueren 1983; Riddick et al. 1986; Howard 1990)

miscible (Yaws et al. 1990)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations, *data at other temperatures are tabulated at end of this section):

4920* (static method, measured range 10 – $80^{\circ}C$, Hovorka et al. 1936)

$\log (P/mmHg) = 8.0588 - 1933.8/(T/K)$; temp range 10 – $80^{\circ}C$ (Antoine eq., static method, Hovorka et al. 1936)

$\log (P/mmHg) = 7.8642 - 1866.7/(T/K)$; temp range ~ 10 – $110^{\circ}C$ (Antoine eq., differential manometer, Gallagher & Hibbert 1937)

4986* (static-Hg manometer, measured range 20 – $105^{\circ}C$, Crenshaw et al. 1938; quoted, Vinson & Martin 1963)

$\log (P/mmHg) = -2316.26/(T/K) - 2.77251 \cdot \log (T/K) + 16.2007$; temp range 20 – $105^{\circ}C$ (Hg manometer, Crenshaw et al. 1938)

5333* (summary of literature data, Stull 1947)

406516* ($154.44^{\circ}C$, static-Bourdon gauge, measured range 154.44 – $310^{\circ}C$, Kobe et al. 1956)

$\log (P/mmHg) = [-0.2185 \times 8546.2/(T/K)] + 7.864110$; temp range -35.8 to $101^{\circ}C$ (Antoine eq., isomer not specified, Weast 1972–73)

5065 (Boublik et al. 1984)

4932 (quoted, Verschueren 1983)

$\log (P/kPa) = 6.66014 - 1556.983/(240.366 + t/^{\circ}C)$; temp range 20 – $105^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/kPa) = 6.56891 - 1550.445/(240.459 + t/^{\circ}C)$; temp range 20 – $125^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

4950, 6135 (25 , $30^{\circ}C$, Riddick et al. 1986)

$\log (P/kPa) = 6.9891 - 1866.7/(T/K)$, temp range not specified (Antoine eq., Riddick et al. 1986)

4915 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P_L/\text{kPa}) = 6.40318 - 1457.97/(-42.888 + T/\text{K})$; temp range 285–375 K (Antoine eq., Stephenson & Malanowski 1987)

5060, 6092 (quoted, calculated-solvatochromic parameters and UNIFAC, Banerjee et al. 1990)

$\log (P/\text{mmHg}) = 20.5761 - 2.4658 \times 10^3/(T/\text{K}) - 4.3645 \cdot \log (T/\text{K}) - 2.7053 \times 10^{-10} \cdot (T/\text{K}) + 8.5235 \times 10^{-6} (T/\text{K})^2$; temp range 285–587 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C or as indicated):

0.495 (calculated as $1/K_{AW}$, C_W/C_A , reported as exptl., Hine & Mookerjee 1975; quoted, Howard 1990)

0.431, 1.564 (calculated-group contribution, calculated-bond contribution method Hine & Mookerjee 1975)

0.698 (computer value, Yaws et al. 1991)

1.609, 4.314, 6.925, 10.19 (dioxane, 40, 60, 70, 80°C, equilibrium headspace-GC, Kolb et al. 1992)

$\ln (1/K_{AW}) = -7.940 + 4798/(T/\text{K})$, temp range 40–80°C (equilibrium headspace-GC, Kolb et al. 1992)

0.496 (quoted from Howard 1989–1991, Capel & Larson 1995)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

−0.42, 0.01 (observed, calculated-f const., Chou & Jurs 1979)

−0.42 (quoted, Verschuereen 1983; quoted, Pinal et al. 1990)

−0.27 (Hansch & Leo 1985; quoted, Howard 1990; Capel & Larson 1995)

−0.27 (recommended, Hansch et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.17 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

1.23 (soil, estimated- K_{OW} , Lyman et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: estimated Henry' law constant suggests that volatilization for 1,4-dioxane from water and moist soil should be slow; however, it has a moderate vapor pressure, so volatilization from dry soil is possible (Howard 1990).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} = 67$ d to 9.1 yr in water, based on measured rates for the reaction with hydroxyl radical in water (Anbar & Neta 1967; Dorfman & Adams 1973; quoted, Howard et al. 1991)

photooxidation $t_{1/2} = 8.1$ –81 h in air, based on measured rate constant for the reaction of 1,3,5-trioxane with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991)

photooxidation $t_{1/2} = 6.69$ –9.6 h in the atmosphere, based on estimated reaction rate with photochemically produced hydroxyl radicals (Howard 1990)

$k_{OH} = 10.9 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson 1989)

$k_{OH}(\text{calc}) = 38.6 \times 10^{-12} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{exptl}) = 10.9 \times 10^{-12} \text{ cm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ at 298 K (SAR structure-activity relationship, Kwok & Atkinson 1995)

$k_{OH}^* = 9.5 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by relative rate method; $k_{OH} = 12.2 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ by pulse laser photolysis-laser induced fluorescence and atmospheric lifetime calculated to be 25 h at 298 ± 2 K; measured range 263–372 K (Moriarty et al. 2003)

Hydrolysis:

Biodegradation: aqueous aerobic $t_{1/2} = 672$ –4320 h, based on unacclimated aerobic aqueous screening test data with confirmed resistance to biodegradation (Sasaki 1978; Kawasaki 1980; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 2688$ –17280 h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991)

$t_{1/2}(\text{aerobic}) = 28$ d, $t_{1/2}(\text{anaerobic}) = 110$ d in natural waters (Capel & Larson 1995)

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24$ h from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976);

$t_{1/2} = 8.1\text{--}81$ h, based on estimated photooxidation half-life in air (Atkinson 1987; quoted, Howard et al. 1991);
 $t_{1/2} = 6.69\text{--}9.6$ h in the atmosphere, based on estimated reaction rate with photochemically produced hydroxyl radical (Howard 1990).

Surface water: $t_{1/2} = 672\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 1344\text{--}8640$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

10.1.2 HALOGENATED ETHERS

10.1.2.1 Epichlorohydrin

Common Name: Epichlorohydrin

Synonym: 1-chloro-2,3-epoxypropane, (chloromethyl)oxirane, α -epichlorohydrin, γ -chloropropylene oxide

Chemical Name: epichlorohydrin, 1-chloro-2,3-epoxypropane, α -epichlorohydrin, γ -chloropropylene oxide

CAS Registry No: 106-89-8

Molecular Formula: C_3H_5OCl

Molecular Weight: 92.524

Melting Point ($^{\circ}C$):

–57.2 (Riddick et al. 1986; Howard 1989)

–26 (Lide 2003)

Boiling Point ($^{\circ}C$):

118 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1807, 1.1746 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

78.4 ($20^{\circ}C$, calculated-density)

90.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

65800 ($20^{\circ}C$, selected, Riddick et al. 1986)

65800 ($20^{\circ}C$, Krijgsheld & Van der Gen 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

2400 (selected, Riddick et al. 1986)

$\log(P/kPa) = 6.5958 - 1587.9/(230 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

2192 (Daubert & Danner 1985)

$\log(P_L/kPa) = 6.5958 - 1587.9/(-43.15 + T/K)$; temp range 328–388 K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 24.764 - 2.8846 \times 10^3/(T/K) - 5.6252 \cdot \log(T/K) - 1.1011 \times 10^{-10} \cdot (T/K) + 5.3331 \times 10^{-7} \cdot (T/K)^2$; temp range 216–610 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$):

3.375 (calculated-P/C using Riddick et al. 1986 data)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

0.30 (Krijgsheld & Van der Gen 1986)

0.45 (shake flask-GC, Deneer et al. 1988)

0.45 (recommended, Sangster 1993)

0.45 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log BCF$:

0.66 (estimated, Santodonato et al. 1980; quoted, Howard 1989)

Sorption Partition Coefficient, $\log K_{oc}$:

2.09 (soil, calculated-S, Lyman et al. 1982; quoted, Howard 1989)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: evaporation $t_{1/2} \sim 29$ h for a model river 1 m deep with a 1 m/s current and 3 m/s wind (Lyman et al. 1982; quoted, Howard 1989).

Photolysis:

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

photooxidation $t_{1/2} \sim 4.0$ d, based on estimation for the photooxidation with hydroxyl radical in air (Cupitt 1980; quoted, Howard 1989)

$k_{OH}(\text{calc}) = 9.9 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{obs.}) = 4.4 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR structure-activity relationship, Atkinson 1985)

$k_{OH} \geq 5.5 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ with reference to *n*-butane for the gas phase reaction with OH radical at $23.3 \pm 0.9^\circ\text{C}$ with an atmospheric lifetime of < 21 d for an average OH radical concentration of 1×10^6 molecules/cm³ (Edney et al. 1986)

$k_{OH}(\text{exptl}) = 4.4 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, $k_{OH}(\text{calc}) = 6.6 \times 10^{-13} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. (SAR, Atkinson 1987)

$k_{O_3}(\text{aq.}) \leq 0.003 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 4.1 and 22°C , with $t_{1/2} \sim 130$ d at pH 7 (Yao & Haag 1991).

Hydrolysis: half-life of 8.2 d in distilled water to hydrolyze to 1-chloropropan-2,3-diol at 20°C and pH 5–9 (Mabey & Mill 1978; quoted, Howard 1989; Howard et al. 1991).

Biodegradation: aqueous aerobic $t_{1/2} = 168$ –672 h, based on estimated unacclimated aqueous aerobic biodegradation screening test data (Bridie et al. 1979; Sasaki 1978; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 672$ –2688 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: photodecomposition $t_{1/2} = 16.0$ h under simulated atmospheric conditions, with NO (Dilling et al. 1976); $t_{1/2} \sim 4.0$ d, based on estimation for the photooxidation with hydroxyl radical in air (Cupitt 1980; quoted, Howard 1989);

$t_{1/2} = 146$ –1458 h, based on measured rate constant for the reaction with hydroxyl radical in air (Atkinson 1985; quoted, Howard et al. 1991); atmospheric lifetime < 21 d due to reactions with OH radical (Edney et al. 1986).

Surface water: evaporation $t_{1/2} = 29$ h for a model river 1 m deep with a 1 m/s current and 3 m/s wind (Lyman et al. 1982; quoted, Howard 1989);

$t_{1/2} = 168$ –672 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

measured rate constant $k \leq 0.003 \text{ M}^{-1} \text{ s}^{-1}$ for direct reaction with ozone in water at pH 4.1 and 22°C , with $t_{1/2} \sim 130$ d at pH 7 (Yao & Haag 1991).

Ground water: 336–1344 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 168$ –672 h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

10.1.2.2 Chloromethyl methyl ether

Common Name: Chloromethyl methyl ether

Synonym: chloromethyl ether, chloromethoxymethane, CMME, monochlorodimethyl ether

Chemical Name: chloromethyl methyl ether

CAS Registry No: 107-30-2

Molecular Formula: C_2H_5ClO , $ClCH_2-O-CH_3$

Molecular Weight: 80.513

Melting Point ($^{\circ}C$):

−103.5 (Verschuereen 1983; Dean 1985; Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$):

59.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0703 (Dean 1985)

1.0605 (Budavari 1989)

Molar Volume (cm^3/mol):

75.2 ($20^{\circ}C$, calculated-density)

81.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

decomposes (Verschuereen 1983)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

24900 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.259 - 1240/(-43.15 + T/K)$; temp range 290–332 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m^3/mol):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k, and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: photooxidation $t_{1/2} = 22.7\text{--}227$ h, based on estimated rate constant for the reaction with hydroxyl radical (Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis: $k = 21\text{ h}^{-1}$ at pH 7 and $25^{\circ}C$ with a calculated $t_{1/2} = 2.0$ min (Van Duuren et al. 1972; quoted, Ellington 1989);

$t_{1/2} = 0.0108\text{--}0.033$ h, based on measured hydrolysis rate constant for bis(chloromethyl) ether (Tou et al. 1974; quoted, Howard et al. 1991) and chloromethyl methyl ether (Ellington et al. 1987; quoted, Ellington 1989; Howard et al. 1991);

hydrolyzed very fast in aqueous solutions with $t_{1/2} < 1.0$ s (Verschuereen 1983).

Biodegradation: aqueous aerobic $t_{1/2} = 168\text{--}672$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991);

aqueous anaerobic $t_{1/2} = 672\text{--}2688$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: $t_{1/2} = 22.7\text{--}227$ h, based on estimated rate constant for the reaction with hydroxyl radical (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 0.0108\text{--}0.033$ h, based on measured hydrolysis rate constant for bis(chloromethyl) ether (Tou et al. 1974; quoted, Howard et al. 1991) and chloromethyl methyl ether (Ellington et al. 1987; quoted, Ellington 1989; Howard et al. 1991).

Ground water: $t_{1/2} = 0.0108\text{--}0.033$ h, based on measured hydrolysis rate constant for bis(chloromethyl) ether (Tou et al. 1974; quoted, Howard et al. 1991) and chloromethyl methyl ether (Ellington et al. 1987; quoted, Ellington 1989; Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 0.0108\text{--}0.033$ h, based on measured hydrolysis rate constant for bis(chloromethyl) ether (Tou et al. 1974; quoted, Howard et al. 1991) and chloromethyl methyl ether (Ellington et al. 1987; quoted, Ellington 1989; Howard et al. 1991).

Biota:

10.1.2.3 Bis(chloromethyl)ether

Common Name: Bis(chloromethyl)ether

Synonym: BCME, Bis-CME, chloro(chloromethoxy)methane, dichloromethylether, (dichloro-dimethyl)ether, sym-dichloromethyl ether, oxybis(chloromethane)

Chemical Name: chloromethyl ether, sym-dichloromethyl ether

CAS Registry No: 542-88-1

Molecular Formula: $C_2H_4Cl_2O$, $ClCH_2-O-CH_2Cl$

Molecular Weight: 114.958

Melting Point ($^{\circ}C$):

−41.5 (Weast 1977; Weast 1982–83; Verschueren 1983; Howard 1989; Lide 2003)

Boiling Point ($^{\circ}C$):

106 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.328 ($15^{\circ}C$, Weast 1982–83)

1.315 (Verschueren 1983)

Molar Volume (cm^3/mol):

102.7 (calculated-Le Bas method at normal boiling point)

87.4 (calculated-density, Stephenson & Malanowski 1987)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

22000 (calculated as per Moriguchi 1975 using Quayle 1953 data, Callahan et al. 1979)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations):

3999 ($22^{\circ}C$, Dreisbach 1952)

$\log(P/mmHg) = -3.4945 - 2.2305 \times 10^3/(T/K) + 6.774 \cdot \log(T/K) - 1.7332 \times 10^{-2} \cdot (T/K) + 9.5511 \times 10^{-6} \cdot (T/K)^2$;
temp range 232–579 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ or as indicated):

21.27 (calculated-P/C, Mabey et al. 1982)

21.27 (20 – $25^{\circ}C$ and low ionic strength, Pankow & Rosen 1988; Pankow 1990)

213.18 (quoted from WERL Treatability Data, Ryan et al. 1988)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

−0.38 (calculated, Radding et al. 1977)

2.40 (calculated, Mabey et al. 1982)

Bioconcentration Factor, $\log BCF$:

1.041 (bluegill sunfish, Veith et al. 1980)

Sorption Partition Coefficient, $\log K_{oc}$:

1.20 (sediment-water, calculated- K_{ow} , Mabey et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: $k \ll 360\ M^{-1}\ h^{-1}$ for singlet oxygen and $k = 3.0\ M^{-1}\ h^{-1}$ for peroxy radical (Mabey et al. 1982)

photooxidation $t_{1/2} = 0.196$ – $1.96\ h$, based on estimated rate constant for reaction with hydroxyl radical in air
(Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis: hydrolyzed very fast in aqueous solution with half-life in the order of 10 s when extrapolated to pure water (Hammond & Alexander 1972; quoted, Verschueren 1983);
rate constant $k = 0.018 \text{ s}^{-1}$ with $t_{1/2} = 38 \text{ s}$ (Tou et al. 1974; quoted, Callahan et al. 1979; Howard et al. 1991);
hydrolysis $t_{1/2} = 10\text{--}38 \text{ s}$ and will rapidly disappear from any aquatic system (Fishbein 1979; quoted, Howard 1989);

$k = 65 \text{ h}^{-1}$ at pH 7.0 at 20°C (quoted, Mabey et al. 1982).

Biodegradation: aqueous aerobic $t_{1/2} = 168\text{--}672 \text{ h}$, based on scientific judgement; aqueous anaerobic $t_{1/2} = 672\text{--}2688 \text{ h}$, based on unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: $t_{1/2} = 0.196\text{--}1.96 \text{ h}$, based on estimated rate constant for reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 0.0106\text{--}0.106 \text{ h}$, based on estimated hydrolysis half-life in water (Howard et al. 1991).

Ground water: $t_{1/2} = 0.0106\text{--}0.106 \text{ h}$, based on estimated hydrolysis in water (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} < 10 \text{ d}$, via volatilization subject to plant uptake from the soil (Ryan et al. 1988);

$t_{1/2} = 0.0106\text{--}0.106 \text{ h}$, based on estimated hydrolysis half-life in water (Howard et al. 1991).

Biota:

10.1.2.4 Bis(2-chloroethyl)ether

Common Name: Bis(2-chloroethyl)ether

Synonym: 2-chloroethyl ether, 1,1'-oxybis(2-chloroethane), bis(β -chloroethyl)ether, Chlorex, 1-chloro-2-(β -chloroethoxy)-ethane, β,β' -dichloroethyl ether, 2,2'-dichloroethyl ether, di(2-chloroethyl)ether, di(chloroethyl)ether, dichlorodiethyl ether, sym-dichlorodiethyl ether

Chemical Name: 2-chloroethyl ether, bis(β -chloroethyl)ether, 1-chloro-2-(β -chloroethoxy)-ethane

CAS Registry No: 111-44-4

Molecular Formula: $C_4H_8Cl_2O$, $ClCH_2CH_2-O-CH_2CH_2Cl$

Molecular Weight: 143.012

Melting Point ($^{\circ}C$):

-51.9 (Lide 2003)

Boiling Point ($^{\circ}C$):

178.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.2200 (Verschuereen 1983)

1.2192 (Dean 1985; Riddick et al. 1986)

Molar Volume (cm^3/mol):

117.3 ($20^{\circ}C$, calculated-density)

147.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

8.66 (Riddick et al. 1986)

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

10200 ($20^{\circ}C$, Du Pont 1966; Verschuereen 1983)

17195 (shake flask-LSC, Veith et al. 1980)

10200 ($20^{\circ}C$, Riddick et al. 1986)

10400*, 10300 ($20^{\circ}C$, $31^{\circ}C$, shake flask-GC/TC, measured range $0-91.7^{\circ}C$, Stephenson 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

156.2 (Antoine eq. regression, temp range $23.5-178.5^{\circ}C$, Stull 1947)

94.64, 186 (20, $25^{\circ}C$, Verschuereen 1977,1983)

207 (selected, Riddick et al. 1986)

$\log(P/kPa) = 7.2289 - 2359.6/(T/K)$, temp range not specified (Antoine eq., Riddick et al. 1986)

143.6 (interpolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.7637 - 1948.62/(-41.974 + T/K)$: temp range $297-452 K$ (Antoine eq., Stephenson & Malanowski 1987)

857.1 (calculated-solvatochromic parameters and UNIFAC, Banerjee et al. 1990)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ or as indicated):

28.97 (calculated-P/C, Lyman et al. 1982; Howard 1989)

1.320 ($20^{\circ}C$, calculated-P/C, Mabey et al. 1982)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.58 (calculated, Leo et al. 1971)

1.12 (shake flask-LSC, Veith et al. 1980)

1.29 (shake flask, Hansch & Leo 1985)

1.29 (recommended, Sangster 1993)

1.29 (recommended, Hansch et al. 1995)

Bioconcentration Factor, log BCF:

1.041	(bluegill sunfish, Barrows et al. 1980)
1.040	(bluegill sunfish, LSC- ¹⁴ C, Veith et al. 1980; Veith & Kosian 1983)
0.964	(microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)
1.15	(calculated, Sabljic 1987)

Sorption Partition Coefficient, log K_{OC} :

1.38	(soil, calculated-S, Lyman et al. 1982)
1.14	(sediment-water, calculated- K_{OW} , Mabey et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: calculated $t_{1/2} = 5.78$ d (as per Mackay & Wolkoff 1973 by Durkin et al. 1975);

$t_{1/2} = 3.5, 4.4$ and 180.5 d for the streams, rivers and lakes, respectively, were estimated using Henry's law constant (Lyman et al. 1982; quoted, Howard 1989).

Photolysis:

Oxidation: photooxidation $t_{1/2} = 4.0$ h, based on an estimated half-life for ethyl ether in the smog chamber (Altshuller et al. 1962 and Laity et al. 1973; quoted, Callahan et al. 1979);

$k \ll 360 \text{ M}^{-1} \cdot \text{h}^{-1}$ for the reaction with singlet oxygen and $k = 24.0 \text{ M}^{-1} \text{ h}^{-1}$ for the reaction with peroxy radical (Mabey et al. 1982);

photooxidation $t_{1/2} = 9.65\text{--}96.5$ h, based on estimated rate constant for the reaction with OH radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis: $t_{1/2} = 40.0$ d was estimated at pH 7 from ethyl chloride data in water at an unspecified temperature (Brown et al. 1975; quoted, Howard 1989);

$t_{1/2} = 0.5\text{--}2.0$ yr, based on data from chlorinated ethanes and propanes (Dilling et al. 1975; quoted, Callahan et al. 1979);

first-order hydrolysis $t_{1/2} = 22$ yr, based on neutral hydrolysis rate constant at 20°C which was extrapolated from data for hydrolysis of dioxane at 100°C (Mabey et al. 1982; quoted, Howard et al. 1991);

$k = 2.6 \times 10^{-5} \text{ h}^{-1}$ at pH 7 and 25°C with a calculated $t_{1/2} = 3.0$ yr (Ellington et al. 1987; quoted, Ellington 1989).

Biodegradation: aqueous aerobic $t_{1/2} = 672\text{--}4320$ h, based on river die-away test data (Ludzack & Ettinger 1963 and Doljido 1979; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 2688\text{--}17280$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation: $k = 3 \times 10^{-9} \text{ mL cell}^{-1} \text{ h}^{-1}$ for the bacterial transformation in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: atmospheric $t_{1/2} = 13.44$ h was estimated for the reaction with OH radical (GEMS 1986; quoted, Howard 1989);

photooxidation $t_{1/2} = 9.65\text{--}96.5$ h, based on estimated rate constant for the reaction with hydroxyl radical in air (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 672\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 1344\text{--}8640$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 672\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota: $t_{1/2} > 4.0$ d but less than 7.0 d in fish tissues (Barrows et al. 1980).

10.1.2.5 Bis(2-chloroisopropyl)ether

Common Name: Bis(2-chloroisopropyl)ether

Synonym: bis(2-chloro-1-methylethyl)ether, dichlorodiisopropyl ether, dichloroisopropyl ether, 2,2'-dichloroisopropyl ether, 2,2'-oxybis(1-chloropropane)

Chemical Name: bis(2-chloroisopropyl)ether, dichlorodiisopropyl ether, dichloroisopropyl ether

CAS Registry No: 108-60-1

Molecular Formula: $C_6H_{12}Cl_2O$, $ClCH_2CH(CH_3)-O-CH(CH_3)CH_2Cl$

Molecular Weight: 171.064

Melting Point ($^{\circ}C$):

-97 (Weast 1977; Verschueren 1983)

Boiling Point ($^{\circ}C$):

187 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1100 (Verschueren 1983)

1.1122 (Dean 1985)

Molar Volume (cm^3/mol):

154.1 ($20^{\circ}C$, calculated-density)

193.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

1700* (room. temp., Verschueren 1977,1983)

2450*, 2370 ($19.1^{\circ}C$, $31.0^{\circ}C$, shake flask-GC, measured range $9.5-91.4^{\circ}C$, Stephenson 1992)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

103.95 (Antoine eq. regression, temp range $24.7-180^{\circ}C$, Stull 1947)

113.31 ($20^{\circ}C$, Verschueren 1977,1983)

112.30 ($28.85^{\circ}C$, Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.68233 - 1856.14/(-58.793 + T/K)$; temp range 302–456 K (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ or as indicated):

11.14 ($20^{\circ}C$, calculated-P/C, Mabey et al. 1982)

11.40 (calculated-P/C from Verschueren 1977/83 data)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.58 (calculated, Leo et al. 1971)

2.10 (calculated, Mabey et al. 1982)

2.48 (HPLC-RT correlation, Kawamoto & Urano 1989)

2.48 (recommended, Sangster 1993)

Bioconcentration Factor, $\log BCF$:

1.544 (microorganisms-water, calculated- K_{ow} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{oc}$:

1.785 (sediment-water, calculated- K_{ow} , Mabey et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization: calculated $t_{1/2} = 1.37$ d (calculated as per Mackay & Wolkoff 1973, Durkin et al. 1975; quoted, Callahan et al. 1979).

Photolysis:

Oxidation: photooxidation $t_{1/2} = 4.0$ h, based on estimated half-life for ethyl ether in a smog chamber (Altshuller et al. 1962 and Laity et al. 1973; quoted, Callahan et al. 1979);

$k \ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for the reaction with singlet oxygen and $k = 2.0 \text{ M}^{-1} \text{ h}^{-1}$ for the reaction with peroxy radical (Mabey et al. 1982).

Hydrolysis: $t_{1/2} = 0.5\text{--}2.0$ yr, based on data from chlorinated ethanes and propanes (Dilling et al. 1975; quoted, Callahan et al. 1979);

$k = 4 \times 10^{-6} \text{ h}^{-1}$ at pH 7.0 and 25°C (Mabey et al. 1982).

Biodegradation: aqueous aerobic $t_{1/2} = 432\text{--}4320$ h, based on river die-away test data (Kleopfer & Fairless 1972; quoted, Howard et al. 1991) and aerobic soil column study data (Kincannon & Lin 1985; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 1728\text{--}17280$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation: $k = 1 \times 10^{-10} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacterial transformation in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: $t_{1/2} = 4.61\text{--}46.1$ h, based on photooxidation half-life in air (Howard et al. 1991).

Surface water: estimated $t_{1/2} = 3.1$ d for surface waters in case of a first order reduction process may be assumed (Zoeteman et al. 1980)

$t_{1/2} = 432\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Ground water: $t_{1/2} = 864\text{--}8640$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 432\text{--}4320$ h, based on estimated unacclimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biota:

FIGURE 10.1.2.5.1 Logarithm of mole fraction solubility ($\ln x$) versus reciprocal temperature for bis(2-chloroisopropyl)ether.

10.1.2.6 2-Chloroethyl vinyl ether

Common Name: 2-Chloroethyl vinyl ether

Synonym: (2-chloroethoxy)-ethene, β -chloroethyl vinyl ether, vinyl 2-chloroethyl ether

Chemical Name: β -chloroethyl vinyl ether, 2-chloroethyl vinyl ether, vinyl 2-chloroethyl ether

CAS Registry No: 110-75-8

Molecular Formula: $C_4H_7Cl_2O$, $ClCH_2CH_2-O-CH=CH_2$

Molecular Weight: 106.551

Melting Point ($^{\circ}C$):

-70 (Lide 2003)

Boiling Point ($^{\circ}C$):

108 (Weast 1977; Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0475 (Weast 1982–83)

1.0480 (Dean 1985)

Molar Volume (cm^3/mol):

101.7 ($20^{\circ}C$, calculated-density)

119.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

15000 (calculated as per Moriguchi 1975, Callahan et al.)

6000 (Dean 1985)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated):

3566 ($20^{\circ}C$, calculated, Dreisbach 1952)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$ or as indicated):

0.0253 (20 – $25^{\circ}C$, calculated-P/C, Mabey et al. 1982)

25.33 (20 – $25^{\circ}C$ and low ionic strength, Pankow & Rosen 1988; Pankow 1990)

24.79 (quoted from WERL Treatability Data, Ryan et al. 1988)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.28 (calculated as per Leo et al. 1971, Callahan et al. 1979)

1.14 (calculated, Mabey et al. 1982)

Bioconcentration Factor, $\log BCF$:

0.672 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{OC}$:

0.820 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: photooxidation $t_{1/2} = 30$ min, based on half-life estimated for 2-methyl-2-butene from smog chamber data (Altshuller et al. 1962 and Laity et al. 1973; quoted, Callahan et al. 1979);

$k = 1 \times 10^{10} M^{-1} \cdot h^{-1}$ for singlet oxygen and $k = 34 M^{-1} h^{-1}$ for peroxy radical (Mabey et al. 1982).

Hydrolysis: $k = 4.4 \times 10^{-10} s^{-1}$, minimum rate at pH 7 and $25^{\circ}C$ in pure water with a maximum $t_{1/2} = 0.48$ yr (Jones & Wood 1964; quoted, Callahan et al. 1979);

$k \sim 4 \times 10^{-6} h^{-1}$ at pH 7.0 and $25^{\circ}C$ with reference to that of bis(2-chloroethyl)ether (Mabey et al. 1982).

Biodegradation:

Biotransformation: $k = 1 \times 10^{-10} \text{ mL cell}^{-1} \text{ h}^{-1}$ for bacterial transformation to water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Soil: $t_{1/2} < 10 \text{ d}$, via volatilization subject to plant uptake from the soil (Ryan et al. 1988).

10.1.2.7 Bis(2-chloroethoxy)methane

Common Name: Bis(2-chloroethoxy)methane

Synonym: bis(β -chloroethyl)formal, β , β -dichlorodiethyl formal, dichlorodiethyl methylal

Chemical Name: bis(2-chloroethoxy)methane

CAS Registry No: 111-91-1

Molecular Formula: $C_5H_{10}Cl_2O_2$, $ClCH_2CH_2-O-CH_2-O-CH_2CH_2Cl$

Molecular Weight: 173.037

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

215 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

Molar Volume (cm^3/mol):

180.0 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

81000 (calculated as per Moriguchi 1975, Callahan et al. 1979;)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

21.58 (Antoine eq. regression, temp range 53 – $215^{\circ}C$, Stull 1947)

< 13.3 (calculated as per Dreisbach 1952 using data of Webb et al. 1962, Callahan et al. 1979)

21.5 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 7.54778 - 2641.33/(-11.518 + T/K)$; temp range 326 – $486 K$ (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$ or as indicated):

0.0284 (20 – $25^{\circ}C$, calculated-P/C, Mabey et al. 1982)

0.0273 (quoted from WERL Treatability Data, Ryan et al. 1988)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

1.260 (calculated as per Leo et al. 1971, Callahan et al. 1979; Ryan et al. 1988)

1.029 (calculated, Mabey et al. 1982)

Bioconcentration Factor, $\log BCF$:

0.568 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, $\log K_{OC}$:

0.716 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: $k \ll 360 M^{-1} h^{-1}$ for singlet oxygen and $k = 52 M^{-1} h^{-1}$ for peroxy radical (Mabey et al. 1982).

Hydrolysis: minimum rate $k = 2.53 \times 10^{-6} L mol^{-1} s^{-1}$ for acid-catalyzed hydrolysis of the acetal linkage at $25^{\circ}C$ (Kankaanperä 1969; quoted, Callahan et al. 1979; Mabey et al. 1982);

$t_{1/2} = 0.5$ – 2.0 yr, based on data of Dilling et al. 1975 on chlorinated ethanes and propanes (quoted, Callahan et al. 1979);

estimated rate constant $k \sim 4 \times 10^{-6} h^{-1}$ at pH 7.0 and $25^{\circ}C$ by analogy to bis(2-chloroethyl)ether (Mabey et al. 1982).

Biodegradation:

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Soil: $t_{1/2} > 50$ d, via volatilization subject to plant uptake from the soil (Ryan et al. 1988).

10.1.3 AROMATIC ETHERS

10.1.3.1 Anisole (Methoxybenzene)

Common Name: Anisole

Synonym: methoxybenzene

Chemical Name: anisole, methoxybenzene, methyl phenyl ether

CAS Registry No: 100-66-3

Molecular Formula: C_7H_8O , $C_6H_5OCH_3$

Molecular Weight: 108.138

Melting Point ($^{\circ}C$):

-37.13 (Lide 2003)

Boiling Point ($^{\circ}C$):

153.7 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.99402, 0.98932 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach & Martin 1949)

0.9940, 0.9893 ($20^{\circ}C$, $25^{\circ}C$, Riddick et al. 1986)

Molar Volume (cm^3/mol):

108.8 ($20^{\circ}C$, calculated-density)

127.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

1514 (shake flask-UV, McGowan et al. 1966)

1536 (shake flask-UV, Vesala 1974)

2030*, 1860 ($20^{\circ}C$, $29.7^{\circ}C$, shake flask-GC/TC, measured range 0 – $90.7^{\circ}C$, Stephenson 1992)

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

497* (calculated-Antoine eq. regression, temp range 5.4 – $155.5^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.35950 - 1718.7/(230 + t/^{\circ}C)$ (Antoine eq., temp range 73 – $154^{\circ}C$, Dreisbach & Martin 1949)

6287* ($73.34^{\circ}C$, ebulliometry, measured range 73.34 – $153.75^{\circ}C$, Dreisbach & Shrader 1949)

26547* ($109.876^{\circ}C$, ebulliometry, measured range 109.876 – $164.114^{\circ}C$, Collerson et al. 1965)

$\log(P/mmHg) = 7.05236 - 1489.756/(203.543 + t/^{\circ}C)$; temp range 109.876 – $164.114^{\circ}C$ (Antoine eq., ebulliometric measurements, Collerson et al. 1965)

$\log(P/mmHg) = 22.84299 - 3033.20/(T/K) - 4.88720 \cdot \log(T/K)$; temp range 109.876 – $164.114^{\circ}C$ (Krichhoff eq., ebulliometric measurements, Collerson et al. 1965)

$\log(P/mmHg) = [-0.2185 \times 10440.9/(T/K)] + 8.221443$; temp range 5.4 – $155.5^{\circ}C$ (Antoine eq., Weast 1972–73)

472* (“recomputed” reported data, ebulliometry, measured range 383 – 437 K, Ambrose et al. 1976)

$\log(P/kPa) = 6.17595 - 1489.502/(T/K - 69.577)$; temp range 383 – 437 K (Antoine eq., ebulliometry, Ambrose et al. 1976)

$\log(P/mmHg) = [1 - 426.827/(T/K)] \times 10^{0.942238 - 10.2065 \times 10^{-4} \cdot (T/K) + 10.6819 \times 10^{-7} \cdot (T/K)^2}$; temp range 346.49 – 415.52 K (Cox eq., Chao et al. 1983)

$\log(P/kPa) = 6.23361 - 1529.735/(208.062 + t/^{\circ}C)$; temp range 73.3 – $153.75^{\circ}C$ (Antoine eq. derived from exptl data of Dreisbach & Shrader 1949, Boublik et al. 1984)

$\log(P/kPa) = 6.17900 - 1490.93/(203.675 + t/^{\circ}C)$; temp range 109.9 – $164.1^{\circ}C$ (Antoine eq. derived from reported exptl data of Collerson et al. 1965, Boublik et al. 1984)

$\log (P/\text{mmHg}) = 7.05269 - 1489.99/(203.57 + t/^{\circ}\text{C})$; temp range 110–164°C (Antoine eq., Dean 1985, 1992)
 472 (selected, Riddick et al. 1986)
 $\log (P/\text{kPa}) = 6.17595 - 1489.502/(203.573 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
 $\log (P_L/\text{kPa}) = 6.17622 - 1489.957/(-69.525 + T/\text{K})$; temp range 382–437 K (Antoine eq., Stephenson & Malanowski 1987)
 204, 383 (quoted, calculated-solvatochromic parameters and UNIFAC, Banerjee et al. 1990)
 $\log (P/\text{mbar}) = 7.11773 - 1451.742/[(T/\text{K}) - 73.252]$; temp range 382–429 K (vapor-liquid equilibrium (VLE)-Fischer still, Reich & Sanhueza 1993)
 $\log (P/\text{mmHg}) = -8.1053 - 2.5386 \times 10^3/(T/\text{K}) + 9.0289 \cdot \log (T/\text{K}) - 2.0426 \times 10^{-2} \cdot (T/\text{K}) + 1.0536 \times 10^{-5} \cdot (T/\text{K})^2$;
 temp range 236–642 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

430.8 (exptl. $1/K_{AW} = C_W/C_A$, Hine & Mookerjee 1975)
 430.8, 358.3 (calculated-group contribution, calculated-bond contribution, Hine & Mookerjee 1975)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.11 (shake flask-UV, Fujita et al. 1964)
 2.04 (shake flask-UV, Rogers & Cammarata 1969)
 2.10 (HPLC-RT correlation, Mirrlees et al. 1976)
 2.08 (Hansch & Leo 1979)
 2.24 (HPLC- k' correlation, Haky & Young 1984)
 2.16 (HPLC-RT correlation, Ge et al. 1987)
 2.15 (HPLC-RT correlation, Minick et al. 1988)
 2.01 (RP-HPLC-RT correlation, ODS column with masking agent, Bechalany et al. 1989)
 2.11 (recommended, Sangster 1989, 1993)
 2.17 (dual-mode centrifugal partition chromatography, Gluck 1990)
 1.67, 1.79 (shake flask-UV/VIS spec.: 25, 60°C, Kramer & Henze 1990)
 2.11 (recommended, Hansch et al. 1995)
 2.41, 2.31, 2.58, 2.55 (HPLC- k' correlation, different combinations of stationary and mobile phases under isocratic conditions, Makovsaky et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

4.01 (head-space GC, Abraham et al. 2001)

Bioconcentration Factor, $\log \text{BCF}$:

1.34 (Isnard & Lambert 1988)

Sorption Partition Coefficient, $\log K_{OC}$:

6.50 (soil, calculated-MCI $^1\chi$, Sabljic et al. 1995)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: rate constant $k = 1.054 \times 10^{-2} \text{ h}^{-1}$ with H_2O_2 under photolysis at 25°C in F-113 solution and with HO- in the gas (Dilling et al. 1988)

Oxidation: rate constant k , for gas-phase second order rate constants, k_{OH} for reaction with OH radical, k_{NO_3} with NO_3 radical and k_{O_3} with O_3 or as indicated, *data at other temperatures see reference:

$k_{OH} = (1.57 \pm 0.24) \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 299 K, measured range 299–435 K (overall rate constant, flash photolysis-resonance fluorescence technique, Perry et al. 1977)

$k_{OH} = 1.57 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson 1985; quoted, Sabljic & Güsten 1990)

$k_{NO_3} = 9.0 \times 10^{-17} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at $298 \pm 2 \text{ K}$ (re-evaluated value, Atkinson et al. 1987)

$k_{OH} = 1.35 \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ in air, extrapolated from lit. data to 25°C (Dilling et al. 1988)

$k_{NO_3} = 2.08 \times 10^{-16} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson et al. 1988; quoted, Sabljic & Güsten 1990)

$k_{OH} = (14.1 - 19.6) \times 10^{-12} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at room temp. to 299.9 K (Atkinson 1989)

Hydrolysis:

Biodegradation:

Biotransformation: degradation $k = 2.86 \times 10^{-17} \text{ mol cell}^{-1} \text{ h}^{-1}$ in pure culture system (Banerjee et al. 1984).
 Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24 \text{ h}$ from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976).

FIGURE 10.1.3.1.2 Logarithm of vapor pressure versus reciprocal temperature for anisole.

10.1.3.2 2-Chloroanisole

Common Name: 2-Chloroanisole

Synonym: 1-chloro-2-methoxybenzene

Chemical Name: 2-chloroanisole

CAS Registry No: 766-51-8

Molecular Formula: C_7H_7ClO , $C_6H_4Cl(OCH_3)$

Molecular Weight: 142.583

Melting Point ($^{\circ}C$): liquid

-26.8 (Stephenson & Malanowski 1987; Lide 2003)

Boiling Point ($^{\circ}C$):

198.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.1911 (Lide 2003)

Molar Volume (cm^3/mol):

119.7 ($20^{\circ}C$, calculated-density)

148.2 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

490 (shake flask-HPLC/UV, Lun et al. 1995)

766 (liquid S_L , RP-HPLC- k' correlation, using chlorobenzenes as reference compound standard, Pfeifer et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$ and the reported temperature dependence equations):

6287 ($115.13^{\circ}C$, ebulliometry, measured range 115.13 – $186.19^{\circ}C$, Dreisbach & Shrader 1949)

$\log(P/mmHg) = 7.54073 - 2012.4/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

$\log(P/kPa) = 6.25236 - 1660.008/(189.207 + t/^{\circ}C)$, temp range 115.13 – $186.19^{\circ}C$ (Antoine eq. derived from exptl data of Dreisbach & Shrader 1949, Boublik et al. 1984)

0.0594 (P_L , extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.66563 - 2012.4/(-43.15 + T/K)$, temp range 388 – 460 K, (Antoine eq., Stephenson & Malanowski 1987)

0.0302 (liquid P_L , GC-RT correlation, Pfeifer et al. 2001)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

9.50 (calculated- P_L/C_L , Pfeifer et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

2.68 (shake flask-UV, Nakagawa et al. 1992)

2.50 (shake flask-HPLC/UV both phases, Lun et al. 1995)

2.72 (RP-HPLC- k' correlation, Pfeifer et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.13 (calculated- K_{ow}/K_{aw} , Pfeifer et al. 2001)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{oc}$:

10.1.3.3 3-Chloroanisole

Common Name: 3-Chloroanisole

Synonym:

Chemical Name:

CAS Registry No: 2845-89-8

Molecular Formula: C_7H_7ClO , $C_6H_4Cl(OCH_3)$

Molecular Weight: 142.583

Melting Point ($^{\circ}C$): liquid

Boiling Point ($^{\circ}C$):

193.5 (Lide 2003)

Density (g/cm^3):

Molar Volume (cm^3/mol):

148.2 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

235 (shake flask-HPLC/UV, Lun et al. 1995)

231 (liquid S_L , RP-HPLC- k' correlation, using chlorobenzenes as reference compound standard, Pfeifer et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0282 (liquid P_L , GC-RT correlation, Pfeifer et al. 2001)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

21.4 (calculated- P_L/C_L , Pfeifer et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.60 (shake flask-HPLC/UV both phases, Lun et al. 1995)

3.09 (RP-HPLC- k' correlation, Pfeifer et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.15 (calculated- K_{OW}/K_{AW} , Pfeifer et al. 2001)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

10.1.3.4 4-Chloroanisole

Common Name: 4-Chloroanisole

Synonym: 1-chloro-4-methoxy-benzene

Chemical Name: 4-chloroanisole

CAS Registry No: 623-12-1

Molecular Formula: C_7H_7ClO , $C_6H_4Cl(OCH_3)$

Molecular Weight: 142.583

Melting Point ($^{\circ}C$):

< -18 (Lide 2003)

Boiling Point ($^{\circ}C$):

197.5 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.201 (Lide 2003)

Molar Volume (cm^3/mol):

118.7 ($20^{\circ}C$, calculated-density)

148.2 (Le Bas method-calculated at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

237 (shake flask-HPLC/UV, Lun et al. 1995)

312 (liquid S_L , RP-HPLC- k' correlation, using chlorobenzenes as reference compound standard, Pfeifer et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0324 (liquid P_L , GC-RT correlation, Pfeifer et al. 2001)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

18.2 (calculated- P_L/C_L , Pfeifer et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.78 ($23^{\circ}C$, shake flask-LSC, Banerjee et al. 1980)

2.78 (recommended, Sangster 1993)

2.70 (shake flask-HPLC/UV both phases, Lun et al. 1995)

3.00 (RP-HPLC- k' correlation, Pfeifer et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.13 (calculated- K_{OW}/K_{AW} , Pfeifer et al. 2001)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Biodegradation: degradation rate constants $k = 2.29 \times 10^{-18} mol cell^{-1} h^{-1}$ from pure culture studies (Banerjee et al. 1984).

Half-Lives in the Environment:

10.1.3.5 2,3-Dichloroanisole

Common Name: 2,3-Dichloroanisole

Synonym:

Chemical Name:

CAS Registry No: 1984-59-4

Molecular Formula: $C_7H_6Cl_2O$, $C_6H_3Cl_2(OCH_3)$

Molecular Weight: 177.028

Melting Point ($^{\circ}C$):

32 (Lun et al. 1995; Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

169.1 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.854 (mp at $32^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

86.9 (shake flask-GC/ECD, Lun et al. 1995)

140.6 (supercooled liquid S_L , RP-HPLC- k' correlation, using chlorobenzenes as reference compound standard, Pfeifer et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0468 (supercooled liquid P_L , GC-RT correlation, Pfeifer et al. 2001)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

44.1 (calculated- P_L/C_L , Pfeifer et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.24 (shake flask-HPLC/UV both phases, Lun et al. 1995)

3.30 (RP-HPLC- k' correlation, Pfeifer et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.05 (calculated- K_{ow}/K_{Aw} , Pfeifer et al. 2001)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$, or Lifetimes, τ :

Half-Lives in the Environment:

10.1.3.6 2,6-Dichloroanisole

Common Name: 2,6-Dichloroanisole

Synonym:

Chemical Name:

CAS Registry No: 1984-65-2

Molecular Formula: $C_7H_6Cl_2O$, $C_6H_3Cl_2(OCH_3)$

Molecular Weight: 177.028

Melting Point ($^{\circ}C$):

10 (Lide 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

169.1 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

13.12 (shake flask-GC/ECD, Lun et al. 1995)

21.8 (liquid S_L , RP-HPLC- k' correlation, using chlorobenzenes as reference compound standard, Pfeifer et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0110 (liquid P_L , GC-RT correlation, Pfeifer et al. 2001)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

113.7 (calculated- P_L/C_L , Pfeifer et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.96 (reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

3.14 (shake flask-HPLC/UV both phases, Lun et al. 1995)

3.10 (RP-HPLC- k' correlation, Pfeifer et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

2.53 (calculated- K_{OW}/K_{AW} , Pfeifer et al. 2001)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

10.1.3.7 2,3,4-Trichloroanisole

Common Name: 2,3,4-Trichloroanisole

Synonym:

Chemical Name:

CAS Registry No: 54135-80-7

Molecular Formula: $C_7H_5Cl_3O$, $C_6H_2Cl_3(OCH_3)$

Molecular Weight: 211.473

Melting Point ($^{\circ}C$):

70 (Lun et al. 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

190.0 (Le Bas method-calculated at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.362 (mp at $70^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

10.8 (shake flask-GC/ECD, Lun et al. 1995)

22.1 (supercooled liquid S_L , RP-HPLC- k' correlation, using chlorobenzenes as reference compound standard, Pfeifer et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$):

0.263 (supercooled liquid P_L , GC-RT correlation, Pfeifer et al. 2001)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

74.7 (calculated- P_L/C_L , Pfeifer et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

3.74 (RP-HPLC-capacity factor correlation, Opperhuizen & Voors 1987)

4.03 (shake flask-GC/ECD, both phases, Lun et al. 1995)

3.92 (RP-HPLC- k' correlation, Pfeifer et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.44 (calculated- K_{OW}/K_{AW} , Pfeifer et al. 2001)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.09 (guppy, concn ratio of C_{fish}/C_{water} , Opperhuizen & Voors 1987)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$, or Lifetimes, τ :

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 1450 mL g^{-1} d^{-1}$; $k_2 = 1.9 d^{-1}$ (guppy, continuous flow aqueous saturation system, Opperhuizen & Voors 1987)

Half-Lives in the Environment:

10.1.3.8 2,4,6-Trichloroanisole

Common Name: 2,4,6-Trichloroanisole

Synonym:

Chemical Name:

CAS Registry No: 87-40-1

Molecular Formula: $C_7H_5Cl_3O$, $C_6H_2Cl_3(OCH_3)$

Molecular Weight: 211.473

Melting Point ($^{\circ}C$): 61.5 (Lide 2003)

Boiling Point ($^{\circ}C$): 241 (Lide 2003)

Density (g/cm^3):

Molar Volume (cm^3/mol):

190.0 (Le Bas method-calculated at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.438 (mp at $61.5^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

13.2 (shake flask-GC/ECD, Lun et al. 1995)

14.6 (supercooled liquid S_L , RP-HPLC- k' correlation, using chlorobenzenes as reference compound standard, Pfeifer et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$):

2.065 (GC-RT correlation, Watanabe & Tatsukawa 1989)

0.0724 (supercooled liquid P_L , GC-RT correlation, Pfeifer et al. 2001)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

218.7 (calculated- P_L/C_L , Pfeifer et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.20 (HPLC-relative retention time correlation, Neilson et al. 1984)

4.11 (RP-HPLC-capacity factor correlation, Opperhuizen & Voors 1987)

3.96 (reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

4.02 (shake flask-GC/ECD, both phases, Lun et al. 1995)

4.05 (RP-HPLC- k' correlation, Pfeifer et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.10 (calculated- K_{OW}/K_{AW} , Pfeifer et al. 2001)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.90 (zebra fish, Neilson et al. 1984)

2.86 (guppy, concn ratio of C_{fish}/C_{water} , Opperhuizen & Voors 1987)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 1600 mL g^{-1} d^{-1}$; $k_2 = 2.5 d^{-1}$ (guppy, continuous flow aqueous saturation system, Opperhuizen & Voors 1987)

Half-Lives in the Environment:

Biota: biological $t_{1/2} < 1 d$ for all trichloro congeners (guppy, Opperhuizen & Voors 1987)

10.1.3.9 2,3,4,5-Tetrachloroanisole

Common Name: 2,3,4,5-Tetrachloroanisole

Synonym:

Chemical Name:

CAS Registry No: 938-86-3

Molecular Formula: $C_7H_4Cl_4O$, $C_6HCl_4(OCH_3)$

Molecular Weight: 245.918

Melting Point ($^{\circ}C$):

88 (Lun et al. 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

210.9 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.241 (mp at $88^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.35 (shake flask-GC/ECD, Lun et al. 1995)

2.76 (supercooled liquid S_L , RP-HPLC- k' correlation, using chlorobenzenes as reference compound standard, Pfeifer et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$):

1.202 (supercooled liquid P_L , GC-RT correlation, Pfeifer et al. 2001)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

153.0 (calculated- P_L/C_L , Pfeifer et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.51 (RP-HPLC-capacity factor correlation, Opperhuizen & Voors 1987)

4.50 (shake flask-GC/ECD, both phases, Lun et al. 1995)

4.57 (RP-HPLC- k' correlation, Pfeifer et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.78 (calculated- K_{OW}/K_{AW} , Pfeifer et al. 2001)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.67 (guppy, concn ratio of C_{fish}/C_{water} , Opperhuizen & Voors 1987)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$, or Lifetimes, τ :

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 940$ $mL\ g^{-1}\ d^{-1}$; $k_2 = 0.42\ d^{-1}$ (guppy, continuous flow aqueous saturation system, Opperhuizen & Voors 1987)

Half-Lives in the Environment:

Biota: biological $t_{1/2} \sim 1-4$ d for all tetrachloro congeners (guppy, Opperhuizen & Voors 1987)

10.1.3.10 2,3,5,6-Tetrachloroanisole

Common Name: 2,3,5,6-Tetrachloroanisole

Synonym:

Chemical Name:

CAS Registry No: 6936-40-9

Molecular Formula: $C_7H_4Cl_4O$, $C_6HCl_4(OCH_3)$

Molecular Weight: 245.918

Melting Point ($^{\circ}C$):

84 (Lun et al. 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

210.9 (Le Bas method-calculated at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.264 (mp at $84^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.82 (shake flask-GC/ECD, Lun et al. 1995)

3.64 (supercooled liquid S_L , RP-HPLC- k' correlation, using chlorobenzene as reference compound standard, Pfeifer et al. 2001)

Vapor Pressure (Pa at $25^{\circ}C$):

0.427 (supercooled liquid P_L , GC-RT correlation, Pfeifer et al. 2001)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

318.4 (calculated- P_L/C_L , Pfeifer et al. 2001)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.68 (RP-HPLC-capacity factor correlation, Opperhuizen & Voors 1987)

4.40 (shake flask-GC/ECD, both phases, Lun et al. 1995)

4.52 (RP-HPLC- k' correlation, Pfeifer et al. 2001)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

3.41 (calculated- K_{OW}/K_{AW} , Pfeifer et al. 2001)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.69 (guppy, concn ratio of C_{fish}/C_{water} , Opperhuizen & Voors 1987)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$, or Lifetimes, τ :

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 1480 mL g^{-1} d^{-1}$; $k_2 = 0.44 d^{-1}$ (guppy, continuous flow aqueous saturation system, Opperhuizen & Voors 1987)

Half-Lives in the Environment:

Biota: biological $t_{1/2} \sim 1-4 d$ for all tetrachloro congeners (guppy, Opperhuizen & Voors 1987)

10.1.3.11 Veratrole (1,2-Dimethoxybenzene)

Common Name: Veratrole

Synonym: 1,2-dimethoxybenzene

Chemical Name: 1,2-dimethoxybenzene

CAS Registry No: 91-16-7

Molecular Formula: C₈H₁₀O₂, C₆H₄(OCH₃)₂

Molecular Weight: 138.164

Melting Point (°C):

22 (Stephenson & Malanowski 1987)

22.5 (Lide 2003)

Boiling Point (°C):

206.7 (Stephenson & Malanowski 1987)

206 (Lide 2003)

Density (g/cm³):

Molar Volume (cm³/mol):

127.1 (calculated-density)

158.6 (Le Bas method-calculated at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C, F: 1.0

Water Solubility (g/m³ or mg/L at 25°C or as indicated. Additional data at other temperatures designated * are compiled at the end of this section):

7160*, 7060 (19.9, 31°C, shake flask-GC, measured range 19.9–91.8°C, Stephenson 1992)

6690 (shake flask-HPLC/UV, Lun et al. 1995)

Vapor Pressure (Pa at 25°C):

$\log (P_L/\text{kPa}) = 8.705 - 3492/(T/\text{K})$, temp range not specified (Antoine eq., Stephenson & Malanowski 1987)

Henry's Law Constant (Pa m³/mol at 25°C):

Octanol/Water Partition Coefficient, $\log K_{\text{OW}}$:

1.79 (Log P Database, Hansch & Leo 1987, quoted, Sangster 1993)

1.79 (HPLC-RT correlation, average value, Ritter et al. 1994)

1.60 (recommended, Hansch et al. 1995)

2.18 (shake flask-HPLC/UV both phases, Lun et al. 1995)

70.6	8770
80.7	9700
91.8	10730

**FIGURE 10.1.3.11.1** Logarithm of mole fraction solubility ($\ln x$) versus reciprocal temperature for veratrole.

10.1.3.12 4,5-Dichloroveratrole

Common Name: 4,5-dichloroveratrole

Synonym:

Chemical Name:

CAS Registry No: 2772-46-5

Molecular Formula: $C_8H_8Cl_2O_2$, $C_6H_2Cl_2(OCH_3)_2$

Molecular Weight: 207.054

Melting Point ($^{\circ}C$):

83 (Lun et al. 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

200.4 (Le-Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.27 (mp at $83^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

71.9 (shake flask-HPLC/UV, Lun et al. 1995)

72.6 (shake flask-GC/ECD, Lun et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

3.11 (shake flask-GC/ECD, both phases, Lun et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k, and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

10.1.3.13 3,4,5-Trichloroveratrole

Common Name: 3,4,5-trichloroveratrole

Synonym:

Chemical Name:

CAS Registry No: 16766-29-3

Molecular Formula: $C_8H_7Cl_3O_2$, $C_6HCl_3(OCH_3)_2$

Molecular Weight: 241.499

Melting Point ($^{\circ}C$):

66 (Lun et al. 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

221.3 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.396 (mp at $66^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2.50 (shake flask-GC, Neilson et al. 1984)

10.3 (shake flask-GC/ECD, Lun et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.60, 5.25 (HPLC-RT correlation, calculated-solubility, Neilson et al. 1984)

4.01 (shake flask-GC/ECD, both phases, Lun et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.50, 3.30 (zebra fish, calculated, Neilson et al. 1984)

Sorption Partition Coefficient, $\log K_{oc}$:

3.20 (sediment, $K_p = 1.6 ml/(kg \text{ of organic C})^{-1}$, batch sorption equilibrium, Remberger et al. 1986)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

10.1.3.14 Tetrachloroveratrole

Common Name: Tetrachloroveratrole

Synonym: 1,2,3,4-tetrachloro-5,6-dimethoxybenzene

Chemical Name: tetrachloroveratrole

CAS Registry No: 944-61-6

Molecular Formula: $C_8H_6Cl_4O_2$, $C_6Cl_4(OCH_3)_2$

Molecular Weight: 275.944

Melting Point ($^{\circ}C$):

90 (Lun et al. 1995)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

242.2 (Le Bas method-calculated at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.23 (mp at $90^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.70 (shake flask-GC, Neilson et al. 1984)

1.59 (shake flask-GC/ECD, Lun et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$):

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.80, 5.90 (HPLC-RT correlation, calculated-solubility, Neilson et al. 1984)

4.70 (Sarrikoski et al. 1986)

5.90 (Part et al. 1992, quoted, Sangster 1993)

4.86 (shake flask-GC/ECD both phases, Lun et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

4.40, 4.50 (zebra fish, calculated, Neilson et al. 1984)

Sorption Partition Coefficient, $\log K_{oc}$:

3.45 (sediment, $K_p = 2.8$ $ml \cdot (kg \text{ of organic C})^{-1}$, batch sorption equilibrium, Remberger et al. 1986)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

10.1.3.15 Phenetole

Common Name: Phenetole

Synonym: ethoxybenzene, ethyl phenyl ether

Chemical Name: ethoxybenzene, ethyl phenyl ether

CAS Registry No: 103-73-1

Molecular Formula: $C_8H_{10}O$, $C_6H_5-O-C_2H_5$

Molecular Weight: 122.164

Melting Point ($^{\circ}C$):

-29.52 (Riddick et al. 1986)

-33.00 (Stephenson & Malanowski 1987)

-29.43 (Lide 2003)

Boiling Point ($^{\circ}C$):

169.84 (Riddick et al. 1986)

172.00 (Stephenson & Malanowski 1987)

169.81 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9651, 0.9605 ($20^{\circ}C$, $25^{\circ}C$, Dreisbach & Martin 1949; Riddick et al. 1986)

Molar Volume (cm^3/mol):

126.6 ($20^{\circ}C$, calculated-density)

150.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1160 (residual volume, Booth & Everson 1948)

550 (shake flask-AS, McGowan et al. 1966)

569 (shake flask-UV, Vesala 1974)

1114 (calculated- K_{OW} , Valvani et al. 1981)

1200 (selected, Riddick et al. 1986)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($18^{\circ}C$, compiled and evaluated data, temp range $18-172^{\circ}C$, Stull 1947)

$\log(P/mmHg) = 7.40281 - 1808.8/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

7605* ($91.89^{\circ}C$, ebulliometry, measured range $91.89-170^{\circ}C$, Dreisbach & Shrader 1949)

20441* ($117.43^{\circ}C$, ebulliometry, measured range $117.43-180.608^{\circ}C$, Collerson et al. 1965)

$\log(P/mmHg) = 7.01980 - 1507.267/(194.357 + t/^{\circ}C)$; temp range $117.43-180.608^{\circ}C$ (Antoine eq., ebulliometric measurements, Collerson et al. 1965)

$\log(P/mmHg) = 24.97404 - 3295.20/(T/K) - 5.53743 \cdot \log(T/K)$; temp range $117.43-180.608^{\circ}C$ (Krichhoff eq., ebulliometric measurements, Collerson et al. 1965)

204* (comparative ebulliometry-extrapolated, measured range $117.438-180.642^{\circ}C$, Ambrose et al. 1976)

$\log(P/kPa) = 6.14658 - 1509.276/\{(T/K) - 78.502\}$; temp range $391-454 K$ (Antoine eq., Ambrose et al. 1976)

$\log(P/kPa) = 6.17151 - 1529.38/(197.132 + t/^{\circ}C)$; temp range $91.89-170^{\circ}C$ (Antoine eq. derived from exptl data of Dreisbach & Martin 1949, Boublik et al. 1984)

$\log(P/kPa) = 6.14656 - 1508.583/(194.512 + t/^{\circ}C)$; temp range $117.4-180.68^{\circ}C$ (Antoine eq. derived reported exptl data of Collerson et al. 1965, Boublik et al. 1984)

204 (selected, Riddick et al. 1986)

$\log(P/kPa) = 6.14658 - 1509.276/(194.648 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

$\log (P_L/\text{kPa}) = 6.14524 - 1508.326/(-78.613 + T/\text{K})$; temp range 390–454 K (Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = -8.3543 - 2.7728 \times 10^3/(T/\text{K}) + 9.4482 \cdot \log (T/\text{K}) - 2.1842 \times 10^{-2} \cdot (T/\text{K}) + 1.1038 \times 10^{-5} \cdot (T/\text{K})^2$; temp range 244–647 K (vapor pressure eq., Yaws 1994)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25°C):

44.5 (calculated-P/C from selected data)

Octanol/Water Partition Coefficient, $\log K_{\text{ow}}$:

2.51 (shake flask, Hansch & Leo 1979; 1987)

2.68 (HPLC- k' correlation, Haky & Young 1984)

2.51 (recommended, Sangster 1993)

2.51 (recommended, Hansch et al. 1995)

Bioconcentration Factor, $\log \text{BCF}$:

Sorption Partition Coefficient, $\log K_{\text{OC}}$:

10.1.3.16 Benzyl ethyl ether

Common Name: Benzyl ethyl ether

Synonym: (ethoxymethyl)benzene, α -ethoxytoluene

Chemical Name: benzyl ethyl ether, (ethoxymethyl)benzene, α -ethoxytoluene

CAS Registry No: 539-30-0

Molecular Formula: $C_9H_{12}O$, $C_6H_5CH_2-O-C_2H_5$

Molecular Weight: 136.190

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

185.6 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

0.9490 (Weast 1982–83)

0.9478 (Dean 1985)

Molar Volume (cm^3/mol):

143.5 ($20^{\circ}C$, calculated-density)

172.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ or as indicated and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

135* (calculated-Antoine eq. regression, Stull 1947)

100 (selected, Riddick et al. 1986)

$\log(P/kPa) = 6.6496 - 1927.21/(230 + t/^{\circ}C)$, temp range not specified (Antoine eq., Riddick et al. 1986)

135 (extrapolated-Antoine eq., Stephenson & Malanowski 1987)

$\log(P_L/kPa) = 6.92406 - 2133.29/(-24.38 + T/K)$; temp range 299–460 K (Antoine eq., Stephenson & Malanowski 1987)

$\log(P/mmHg) = 27.6421 - 3.4249 \times 10^3/(T/K) - 6.5804 \cdot \log(T/K) + 9.3417 \times 10^{-10} \cdot (T/K) + 1.0547 \times 10^{-6} \cdot (T/K)^2$; temp range 309–660 K (vapor pressure eq., Yaws 1994)

95.44* ($25.35^{\circ}C$, transpiration method, measured range 278.3–313.7 K, Krasnykh et al. 2002)

$\ln(P/Pa) = (305.859/R) - [79968.084/R(T/K)] - (88.80/R) \cdot \ln[(T/K)/298.15]$; temp range 278–313.7 K (transpiration method, Krasnykh et al. 2002)

Henry's Law Constant (Pa m^3/mol at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

2.64 (calculated-f const. as per Rekker 1977, Hanai et al. 1981)

2.16 (Wang et al. 1987)

2.16 (recommended, Sangster 1993)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24$ h from air for the reaction with OH radical (Darnall et al. 1976).

TABLE 10.1.3.16.1

Reported vapor pressures of benzyl ethyl ether at various temperatures and the coefficients for the vapor pressure equations

$$\log P = A - B/(T/K) \quad (1) \quad \ln P = A - B/(T/K) \quad (1a)$$

$$\log (P/\text{mmHg}) = A - B/(C + t/^{\circ}\text{C}) \quad (2) \quad \ln P = A - B/(C + t/^{\circ}\text{C}) \quad (2a)$$

$$\log (P/\text{Pa}) = A - B/(C + T/K) \quad (3)$$

$$\log (P/\text{mmHg}) = A - B/(T/K) - C \cdot \log (T/K) \quad (4)$$

10.1.3.17 Styrene oxide

Common Name: Styrene oxide

Synonym: (1,2-epoxyethyl)benzene, phenylepoxyethane

Chemical Name: (1,2-epoxyethyl)benzene, phenylepoxyethane, styrene oxide

CAS Registry No: 96-09-3

Molecular Formula: C_8H_8O

Molecular Weight: 120.149

Melting Point ($^{\circ}C$):

-35.6 (Weast 1982–83; Lide 2003)

Boiling Point ($^{\circ}C$):

194.1 (Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0523 ($16^{\circ}C$, Weast 1982–83; Dean 1985)

1.0500 (Verschueren 1983)

Molar Volume (cm^3/mol):

114.4 ($20^{\circ}C$, calculated-density)

136.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2800 (quoted, Verschueren 1983)

3020; 4570 (quoted exptl.; calculated-group contribution method, Kühne et al. 1995)

Vapor Pressure (Pa at $25^{\circ}C$):

40.0 (Verschueren 1983)

Henry's Law Constant (Pa m^3/mol):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

1.84 (shake flask-HPLC, Pratesi et al. 1979)

1.51 (shake flask-GC, Serrentino et al. 1983)

1.61 (shake flask, Log P Database, Hansch & Leo 1987)

1.43 (Deneer et al. 1988)

1.61 (recommended, Sangster 1989, 1993)

1.51 (pH 7.5, Hansch et al. 1995)

Bioconcentration Factor, $\log BCF$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: $t_{1/2} = 12.3\text{--}123\text{ h}$, based on estimated photooxidation rate constant with hydroxyl radical (Atkinson 1987; quoted, Howard et al. 1991).

Hydrolysis: rate constants $k = (434 \pm 12) \times 10^{-8}\text{ s}^{-1}$ at pH 7.25 and $k = (1690 \pm 620) \times 10^{-8}\text{ s}^{-1}$ at pH 7.3 in sediment pores both at $25^{\circ}C$ for water containing 0.1% w/w CH_2O as sterilant with 1-phenyl-1,2-ethanediol as major hydrolyzed product (Haag & Mill 1988);

$t_{1/2} = 0.00385\text{--}27.5$ h, based on an estimation from measured first-order rate constants at 25°C, the hydrolysis half-lives at pH 5, 7 and 9 are 0.00385, 21.4 and 27.5 h (Haag & Mill 1988; quoted, Howard et al. 1991).

Biodegradation: aqueous aerobic $t_{1/2} = 24\text{--}168$ h, based on biological screening test data (Schmidt-Bleek et al. 1982; quoted, Howard et al. 1991); aqueous anaerobic $t_{1/2} = 96\text{--}672$ h, based on estimated aqueous aerobic biodegradation half-life (Howard et al. 1991).

Biotransformation:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24$ h from air for the reaction with OH radical (US EPA 1974; quoted, Darnall et al. 1976);

$t_{1/2} = 12.3\text{--}123$ h, based on estimated photooxidation rate constant with hydroxyl radical (Atkinson 1987; quoted, Howard et al. 1991).

Surface water: $t_{1/2} = 0.00385\text{--}27.5$ h, based on an estimation from measured first-order rate constants at 25°C (Haag & Mill 1988; quoted, Howard et al. 1991).

Ground water: $t_{1/2} = 0.00385\text{--}27.5$ h, based on an estimation from measured first-order rate constants at 25°C (Haag & Mill 1988; quoted, Howard et al. 1991).

Sediment:

Soil: $t_{1/2} = 0.00385\text{--}27.5$ h, based on an estimation from measured first-order rate constants at 25°C (Haag & Mill 1988; quoted, Howard et al. 1991).

Biota:

10.1.3.18 Diphenyl ether

Common Name: Diphenyl ether

Synonym: phenyl ether, diphenyl oxide, phenyl ether, 1,1'-oxybisbenzene, phenoxybenzene

Chemical Name: diphenyl ether, diphenyloxide, phenylether, phenoxybenzene

CAS Registry No: 101-84-8

Molecular Formula: $C_{12}H_{10}O$, $(C_6H_5)_2O$

Molecular Weight: 170.206

Melting Point ($^{\circ}C$):

26.87 (Lide 2003)

Boiling Point ($^{\circ}C$):

258 (Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.0748 (Weast 1982–83)

Molar Volume (cm^3/mol):

158.6 ($20^{\circ}C$, calculated-density)

166.6 (Ruelle & Kesselring 1997)

195.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

17.217 (quoted, Riddick et al. 1986)

16.16 (Ruelle & Kesselring 1997)

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$, F: 0.923 (mp $28.5^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

4000 (shake flask-residue-volume, Booth & Everson 1948)

18.7 (shake flask-UV, Vesala 1974)

18.0 (shake flask-HPLC, Banerjee et al. 1980; Pearlman et al. 1984)

21.0 (Verschuereen 1983)

18, 3900 (quoted values, Riddick et al. 1986)

46.88 (supercooled liquid S_L , RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations. Additional data at other temperatures designated * are compiled at the end of this section):

133.3* ($66.1^{\circ}C$, summary of literature data, temp range 66.1 – $258.5^{\circ}C$, Stull 1947)

10.01* ($40^{\circ}C$, dynamic method, measured range 40 – $60^{\circ}C$, Bent & Francel 1948)

$\log(P/mmHg) = 9.6842 - 3351.9/(t/^{\circ}C + 273.1)$; measured range 40 – $60^{\circ}C$ (dynamic method-gas saturation, Bent & Francel 1948)

$\log(P/mmHg) = 7.65339 - 2330.5/(230 + t/^{\circ}C)$ (Antoine eq., Dreisbach & Martin 1949)

26555* ($204.213^{\circ}C$, ebulliometry, measured range 204.2 – $270.9^{\circ}C$, Collerson et al. 1965)

$\log(P/mmHg) = 7.06376 - 1261.455/(221.982 + t/^{\circ}C)$; temp range 204.2 – $270.9^{\circ}C$ (Antoine eq., ebulliometric measurements, Collerson et al. 1965)

$\log(P/mmHg) = 19.48322 - 2328.0/(T/K) - 3.92657 \cdot \log(T/K)$; temp range 204.2 – $270.9^{\circ}C$ (Krichhoff eq., ebulliometric measurements, Collerson et al. 1965)

$\log(P/mmHg) = [-0.2185 \times 12325.5/(T/K)] + 7.955679$; temp range 66.1 – $258.5^{\circ}C$ (Antoine eq., Weast 1972–73)

3.0* (“recomputed” reported data, temp range 204.257 – $271^{\circ}C$, Ambrose et al. 1976)

$\log(P/kPa) = 6.13913 - 1802.984/\{(T/K) - 95.013\}$; temp range 477 – $544\ K$ (Antoine eq., Ambrose et al. 1976)

2.67 (Verschuereen 1983)

1.82 (calculated-Antoine eq., Boublik et al. 1984)

$\log(P/kPa) = 7.01104 - 1799.712/(177.744 + t/^{\circ}C)$; temp range 204 – $270^{\circ}C$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{kPa}) = 6.13606 - 1799.811/(177.756 + t/^{\circ}\text{C})$; temp range 204.2–271 $^{\circ}\text{C}$ (Antoine eq. from reported exptl. data, Boublik et al. 1984)

$\log (P/\text{mmHg}) = 7.01104 - 1799.71/(177.74 + t/^{\circ}\text{C})$; temp range: 204–271 $^{\circ}\text{C}$ (Antoine eq., Dean 1985, 1992)
2.84 (selected, Riddick et al. 1986)

$\log (P/\text{kPa}) = 6.13913 - 1902.984/(178.137 + t/^{\circ}\text{C})$, temp range not specified (Antoine eq., Riddick et al. 1986)
2.93 (calculated-Antoine eq., Stephenson & Malanowski 1987)

$\log (P/\text{kPa}) = 8.7109 - 3351.9/(T/\text{K})$; temp range 313–333K (Antoine eq., liquid, Stephenson & Malanowski 1987)

$\log (P/\text{kPa}) = 6.1553 - 1800.743/(T/\text{K} - 95.275)$; temp range 477–544K (Antoine eq., liquid, Stephenson & Malanowski 1987)

$\log (P/\text{mmHg}) = -26.9635 - 2.5909 \times 10^3/(T/\text{K}) + 16.42 \cdot \log (T/\text{K}) - 2.4334 \times 10^{-2} \cdot (T/\text{K}) + 1.0244 \times 10^{-5} \cdot (T/\text{K})^2$; temp range 300–763 K (vapor pressure eq., Yaws 1994)

2.40 (P_L , GC-RI correlation, Kurz & Ballschmiter 1999)

Henry's Law Constant ($\text{Pa m}^3/\text{mol}$ at 25 $^{\circ}\text{C}$):

25.1 (calculated-P/C using selected data)

8.71 (calculated-P/C, Kurz & Ballschmiter 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.21, 4.36 (shake flask values, Leo et al. 1971)

4.20 (shake flask-GC, Chiou et al. 1977)

4.25 (calculated-fragment const., Rekker 1977)

4.26 (Hansch & Leo 1979)

4.08 (shake flask-HPLC, Banerjee et al. 1980)

3.79 (estimated-HPLC/MS correlation, Burkhard et al. 1985)

4.24 (calculated-f const., Burkhard et al. 1985)

3.87 (HPLC-RT correlation, Eadsforth 1986)

4.28 (shake flask, Log P Database, Hansch & Leo 1987)

4.21 (recommended, Sangster 1989, 1993)

3.949, 4.014 (shake flask method, Brooke et al. 1990)

4.21 (recommended, Hansch et al. 1995)

3.97 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

6.42 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log \text{BCF}$:

2.29 (rainbow trout, calculated, Veith et al. 1979)

2.29; 2.89 (quoted exptl., calculated- K_{OW} , Mackay 1982)

Sorption Partition Coefficient, $\log K_{OC}$:

3.29; 3.41 (soil, quoted exptl.; calculated-MCI χ , Meylan et al. 1992)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

$k_1 = 5.5 \text{ h}^{-1}$, $k_2 = 0.0275 \text{ h}^{-1}$ (trout, Hawker & Connell 1985)

$1/k_2 = 36 \text{ h}$ (trout, Hawker & Connell 1988)

$k_2 = 0.676 \text{ h}^{-1}$ (fish, quoted, Thomann 1989)

Half-Lives in the Environment:

Air: disappearance $t_{1/2} < 0.24 \text{ h}$ from air for the reaction with OH radical (USEPA 1974; quoted, Darnall et al. 1976).

TABLE 10.1.3.18.1

Reported vapor pressures of diphenyl ether at various temperatures and the coefficients for the vapor pressure equations

log P = A – B/(T/K)		(1)	ln P = A – B/(T/K)		(1a)			
log P = A – B/(C + t/°C)		(2)	ln P = A – B/(C + t/°C)		(2a)			
log P = A – B/(C + T/K)		(3)						
log P = A – B/(T/K) – C·log (T/K)		(4)

10.1.4 POLYCHLORINATED DIPHENYL ETHERS (PCDEs)

10.1.4.1 2-Chlorodiphenyl ether (PCDE-1)

Common Name: 2-Chlorodiphenyl ether

Synonym: 2-CDPE, PCDE-1, 2-chlorobiphenyl ether

Chemical Name: 2-chlorodiphenyl ether

CAS Registry No: 2689-07-8

Molecular Formula: $C_{12}H_9ClO$

Molecular Weight: 204.652

Melting Point ($^{\circ}C$):

45 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

216.5 (calculated-Le Bas method at normal boiling point)

179.5 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.634 (mp at $45^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

3.40; 4.80 (quoted exptl.; calculated-molar volume and MP, Ruelle & Kesselring 1997)

3.40 (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

0.537 (P_L , GC-RI correlation, Kurz & Ballschmiter 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

32.36 (calculated-P/C, Kurz & Ballschmiter 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.45 (HPLC-RI correlation, Kurz & Ballschmiter 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

6.33 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Photolysis: photolysis rate $k_p = 0.0035$ d^{-1} with a half-life of 200 d in summer sunlight; $k_p(exptl) = 3.4 \times 10^{-8}$ s^{-1} with $t_{1/2} = 240$ h, $k_p(calc) = 3.1 \times 10^{-9}$ s^{-1} in winter sunlight, at $40^{\circ}C$ in surface waters (Dulin et al. 1986)

Half-Lives in the Environment:

Air:

Surface water: photolysis $t_{1/2} = 200$ d in summer sunlight and $t_{1/2} = 240$ d in winter sunlight at $40^{\circ}C$ in surface waters (Dulin et al. 1986)

Ground water:

Sediment:

Soil:

Biota: $t_{1/2} = 4-63$ d in trout Cl_1 -DPEs to Cl_4 -DPEs (Niimi et al. 1994).

10.1.4.2 4-Chlorodiphenyl ether

Common Name: 4-Chlorodiphenyl ether

Synonym: 4-chlorophenyl phenyl ether, 1-chloro-4-phenoxybenzene, p-chlorophenyl phenyl ether, 4-chlorodiphenyl ether, monochlorodiphenyl oxide

Chemical Name: 4-chlorophenyl phenyl ether, 4-chlorodiphenyl ether

CAS Registry No: 7005-72-3

Molecular Formula: $C_{12}H_9ClO$

Molecular Weight: 204.652

Melting Point ($^{\circ}C$):

−6.0 (Callahan et al. 1979)

−8.0 (Mabey et al. 1982)

Boiling Point ($^{\circ}C$):

284.5 (Weast 1982–83; Lide 2003)

Density (g/cm^3 at $20^{\circ}C$):

1.2026 ($15^{\circ}C$, Weast 1982–83; Lide 2003)

Molar Volume (cm^3/mol):

216.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

3.30 (Branson 1977; quoted, Callahan et al. 1979; Mabey et al. 1982)

59.04 (Isnard & Lambert 1988,1989)

Vapor Pressure (Pa at $25^{\circ}C$):

0.360 (calculated, Branson 1977; quoted, Callahan et al. 1979; Mabey et al. 1982)

Henry's Law Constant ($Pa m^3/mol$ at $25^{\circ}C$ or as indicated):

22.19 (calculated-P/C, Mabey et al. 1982)

22.29 (20 – $25^{\circ}C$ and low ionic strength, quoted, Pankow & Rosen 1988; Pankow 1990)

24.79 (quoted from WERL Treatability Data, Ryan et al. 1988)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.08 (Branson 1977; quoted, Callahan et al. 1979; Ryan et al. 1988; Isnard & Lambert 1988,1989)

5.079 (calculated, Mabey et al. 1982)

Bioconcentration Factor, $\log BCF$:

2.867 (rainbow trout muscle, Branson 1977; quoted, Callahan et al. 1979)

4.255 (microorganisms-water, calculated- K_{ow} , Mabey et al. 1982)

2.87 (quoted, Isnard & Lambert 1988)

Sorption Partition Coefficient, $\log K_{oc}$:

4.763 (sediment-water, calculated- K_{ow} , Mabey et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photolysis rate $k_p = 0.19 d^{-1}$ with $t_{1/2} = 3.6 d$ in summer sunlight; $k_p(exptl) < 2.0 \times 10^{-8} s^{-1}$ with $t_{1/2} > 400 h$, $k_p(calc) = 3.7 \times 10^{-8} s^{-1}$ in winter sunlight, both at $40^{\circ}C$ in surface waters (Dulin et al. 1986)

Oxidation: $k \ll 360 M^{-1} h^{-1}$ for singlet oxygen and $k \ll 1.0 M^{-1} h^{-1}$ for peroxy radical (Mabey et al. 1982)

Hydrolysis:

Biodegradation: $t_{1/2} = 4.0$ h, measured only in activated sludge (Branson 1978; quoted, Callahan et al. 1979).

Biotransformation: estimated rate constant $k = 1 \times 10^{-7}$ mL cell⁻¹ h⁻¹ for bacterial transformation in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

Surface water: photolysis $t_{1/2} = 3.6$ d summer sunlight and $t_{1/2} > 400$ d in winter sunlight at 40° L surface waters (Dulin et al. 1986)

10.1.4.3 2,4-Dichlorodiphenyl ether (PCDE-8)

Common Name: 2,4-Dichlorodiphenyl ether

Synonym: 2,4-DCDPE, PCDE-8

Chemical Name:

CAS Registry No: 51892-26-3

Molecular Formula: $C_{12}H_8Cl_2O$

Molecular Weight: 239.097

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

237.4 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

5.605 (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

0.123 (P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

5.25 (calculated-P/C, Kurz & Ballschmiter 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.62 (Oliver & Niimi 1984)

4.93 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

7.60 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.97 (rainbow trout, Oliver & Niimi 1984)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: $t_{1/2} = 3\text{--}63\ d$ for Cl_1 -DPEs to Cl_4 -DPEs in trout (Niimi et al. 1994).

10.1.4.4 2,6-Dichlorodiphenyl ether (PCDE-10)

Common Name: 2,6-Dichlorodiphenyl ether

Synonym: 2,6-DCDPE, PCDE-10

Chemical Name:

CAS Registry No: 28419-69-4

Molecular Formula: $C_{12}H_8Cl_2O$

Molecular Weight: 239.097

Melting Point ($^{\circ}C$):

39 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

237.4 (calculated-Le Bas method at normal boiling point)

192.4 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.729 (mp at $39^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2.08; 0.213 (quoted exptl., calculated-molar volume and mp, Ruelle & Kesselring 1997)

2.08 (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

0.174 (supercooled liquid P_L , GC-RI correlation, Kurz & Kesselring 1997)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

19.95 (calculated-P/C, Kurz & Kesselring 1997)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

4.64 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

6.73 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: $t_{1/2} = 4-63$ d Cl_1 -DPEs to Cl_4 -DPEs in trout (Niimi et al. 1994).

10.1.4.5 2,4,4'-Trichlorodiphenyl ether (PCDE-28)

Common Name: 2,4,4'-Trichlorodiphenyl ether

Synonym: 2,4,4'-TCDPE, PCDE-28

Chemical Name: 2,4,4'-trichlorodiphenyl ether

CAS Registry No: 59030-21-3

Molecular Formula: $C_{12}H_7Cl_3O$

Molecular Weight: 273.543

Melting Point ($^{\circ}C$):

oil (Navalainen et al. 1994)

40 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

258.3 (calculated-Le Bas method at normal boiling point)

205.3 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.712 (mp at $40^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.102; 0.0385 (quoted exptl.; calculated-molar volume and mp, Ruelle & Kesselring 1997)

0.101 (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0204 (supercooled liquid P_L , GC-RI correlation, Kurz & Ballschmiter 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

33.88 (calculated-P/C, Kurz & Ballschmiter 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.53 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

7.19 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

2.98; 3.36 (concn of 2,4,4'-trichloro-DPE 39.3; 118 $\mu g/L$, juvenile Atlantic salmon, 96-h exposure, Zitko & Carson 1977)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: excretion $t_{1/2} = 235$ h following uptake from water, excretion $t_{1/2} = 15$ d following uptake from food for Juvenile salmon (Zitko & Carson 1977);

average $t_{1/2} = 15$ d in salmon for trichloro-DPE congeners; biological $t_{1/2} = 63$ d (range 46–104 d) in rainbow trout (average value for trichlorodiphenyl ethers (Niimi 1986);

$t_{1/2} = 4$ –63 d Cl_1 -DPEs to Cl_4 -DPEs in trout (Niimi et al. 1994).

10.1.4.6 2,4,5-Trichlorodiphenyl ether (PCDE-29)

Common Name: 2,4,5-Trichlorodiphenyl ether

Synonym: 2,4,5-TCDPE, PCDE-29

Chemical Name: 2,4,5-trichlorodiphenyl ether

CAS Registry No: 52322-80-2

Molecular Formula: $C_{12}H_7Cl_3O$

Molecular Weight: 273.543

Melting Point ($^{\circ}C$):

oil (Opperhuizen & Voors 1987)

61 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

258.3 (calculated-Le Bas method at normal boiling point)

205.3 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.443 (mp at $61^{\circ}C$)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.050 (Opperhuizen 1986)

0.072; 0.0486 (quoted exptl., calculated-molar volume and mp, Ruelle & Kesselring 1997)

0.072 (supercooled liquid value, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0288 (P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$):

112.2 (calculated-P/C, Kurz & Ballschmiter 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.0 (estimated, Opperhuizen 1986)

5.44 (Opperhuizen & Voors 1987; quoted, Niimi et al. 1994)

5.58 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

6.92 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

4.18 (guppy, 8-d exposure, Opperhuizen & Voors 1987)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Biotransformation: rate of metabolism $k = 0.27$ d^{-1} (guppy, 8-d exposure, Opperhuizen & Voors 1987)

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 > 5 \times 10^2$ d^{-1} (guppy, Opperhuizen 1986)

$k_1 = 1.5 \times 10^3$ mL g^{-1} d^{-1} (guppy, 8-d exposure, Opperhuizen & Voors 1987)

$k_2 = 0.34$ d^{-1} (guppy, elimination period 56 d, Opperhuizen & Voors 1987)

Half-Lives in the Environment:

Biota: average excretion $t_{1/2} = 15$ d for trichloro-DPE congeners in salmon; biological $t_{1/2} = 63$ d in rainbow trout (average value for trichlorodiphenyl ethers, Niimi 1986);
 $t_{1/2} = 4\text{--}63$ d for Cl₁-DPEs to Cl₄-DPEs in trout (Niimi et al. 1994).

10.1.4.7 2,4',5-Trichlorodiphenyl ether (PCDE-31)

Common Name: 2,4',5-Trichlorodiphenyl ether

Synonym: 2,4',5-TCDPE, PCDE-31

Chemical Name: 2,4',5-trichlorodiphenyl ether

CAS Registry No: 65075-00-5

Molecular Formula: $C_{12}H_7Cl_3O$

Molecular Weight: 273.543

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

258.3 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0993 (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

0.0229 (supercooled liquid P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

6.31 (calculated-P/C, Kurz & Ballschmiter 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.66 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

5.70 (GC-RT correlation, Hackenberg et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.25 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.30; 2.93 (ave. concn of 2,4',5-trichloro-DPE 2.37; 7.01 $\mu g/L$, juvenile Atlantic salmon, 96-d exposure, Zitko & Carson 1976)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: excretion $t_{1/2} = 310\ h$ following uptake from water; $t_{1/2} = 26\ d$ following uptake from food for juvenile Atlantic salmon (Zitko & Carson 1976);

average excretion $t_{1/2} = 15\ d$ for trichloro-DPE congeners in salmon; biological $t_{1/2} = 63\ d$ in rainbow trout (average value for trichlorodiphenyl ethers, Niimi 1986);

$t_{1/2} = 4\text{--}63\ d$ Cl_1 -DPEs to Cl_4 -DPEs in trout (Niimi et al. 1994).

10.1.4.8 2,2',4,4'-Tetrachlorodiphenyl ether (PCDE-47)

Common Name: 2,2',4,4'-Tetrachlorodiphenyl ether

Synonym: 2,2',4,4'-TCDPE, PCDE-47, 2,2',4,4'-tetrachlorobiphenyl ether, 2,2',4,4'-TCBP

Chemical Name: 2,2',4,4'-tetrachlorodiphenyl ether

CAS Registry No: 28076-73-5

Molecular Formula: $C_{12}H_6Cl_4O$

Molecular Weight: 307.988

Melting Point ($^{\circ}C$):

69–70 (Navalainen et al. 1994)

69 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

279.2 (calculated-Le Bas method at normal boiling point)

218.2 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$, F: 0.366 (mp at $69.5^{\circ}C$))

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.0466; 0.0154 (quoted exptl., calculated-molar volume and mp, Ruelle & Kesselring 1997)

0.0466 (supercooled liquid, RP-HPLC-RI, Kurz & Ballschmiter 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

0.00525 (P_L , GC-RI correlation, Kurz & Ballschmiter 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

34.67 (calculated-P/C, Kurz & Ballschmiter 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.95 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Octanol/Air Partition Coefficient, $\log K_{AO}$:

7.80 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: average excretion $t_{1/2} = 55$ d in salmon for tetrachloro-DPE congeners; mean biological $t_{1/2} = 119$ d (range 82–213 d) in rainbow trout (Niimi 1986);

$t_{1/2} = 4$ –63 d for Cl_1 -DPEs to Cl_4 -DPEs in trout (Niimi et al. 1994).

10.1.4.9 2,3',4,4'-Tetrachlorodiphenyl ether (PCDE-66)

Common Name: 2,3',4,4'-Tetrachlorodiphenyl ether

Synonym: 2,3',4,4'-DCPE, PCDE-66

Chemical Name: 2,3',4,4'-tetrachlorodiphenyl ether

CAS Registry No: 61328-46-9

Molecular Formula: $C_{12}H_6Cl_4O$

Molecular Weight: 307.988

Melting Point ($^{\circ}C$):

oil (Navalainen et al. 1994)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

279.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

5.06×10^{-3} ; 0.0153 (quoted exptl., calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

8.406×10^{-3} (supercooled liquid value, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

$\log [S_L/(mol/L)] = -1.392 - 866.2/(T/K)$ (liquid, Passivirta et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.35×10^{-3} (P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

1.34×10^{-3} ; 1.34×10^{-3} (liquid P_L , GC-RT correlation; converted to solid P_S with fugacity ratio F, Passivirta et al. 1999)

$\log (P_S/Pa) = 11.90 - 4404/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 8.95 - 3525/(T/K)$ (liquid, Passivirta et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ and reported temperature dependence equations):

54.95 (calculated-P/C, Kurz & Ballschmiter 1999)

$\log [H/(Pa \cdot m^3/mol)] = 10.34 - 2659/(T/K)$ (Passivirta et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.38 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

7.46, 7.20 (quoted lit., calculated from lit. $\log K_{OW}$ and estimated $\log S_L$, Passivirta et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.03 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

3.15; 2.77 (4.01; 12.0 $\mu g/L$, ave. concn of 2,2',4,4',5-PCDPE (reported as 2,2'4',5-TCDDPE), juvenile Atlantic salmon, 96-d exposure, Zitko & Carson 1976)

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: excretion $t_{1/2} = 370$ h following uptake from water, $t_{1/2} = 55$ d following uptake from food in juvenile Atlantic salmon (Zitko & Carson 1977);

average excretion $t_{1/2} = 55$ d in salmon for pentachloro-DPE congeners; mean biological $t_{1/2} = 144$ d (range 93–311 d) in rainbow trout (Niimi 1986);

$t_{1/2} = 15$ d for Cl_4 -DPE to Cl_5 -DPE in waterborne exposed salmon and $t_{1/2} = 55$ d for diet-exposed fish (Niimi et al. 1994).

10.1.4.14 2,2',4,4',6-Pentachlorodiphenyl ether (PCDE-100)

Common Name: 2,2',4,4',6-Pentachlorodiphenyl ether

Synonym: 2,2',4,4',6-PCDE, PCDE-100

Chemical Name: 2,2',4,4',6-pentachlorodiphenyl ether

CAS Registry No: 104294-16-8

Molecular Formula: $C_{12}H_5Cl_5O$

Molecular Weight: 342.433

Melting Point ($^{\circ}C$):

45–46 (Navalainen et al. 1994)

46 (Passivirta et al. 1999)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

300.1 (calculated-Le Bas method at normal boiling point)

231.1 (Passivirta et al. 1999)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

56.5 (calculated, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 1.0

1.0 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

0.0160 (supercooled liquid value, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

$\log [S_L/(mol/L)] = -1.392 - 943.0/(T/K)$ (liquid, Passivirta et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

2.19×10^{-3} (supercooled liquid P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

2.17×10^{-3} ; 1.34×10^{-3} (liquid P_L , GC-RT correlation; converted to solid P_S with fugacity ratio F, Passivirta et al. 1999)

$\log (P_S/Pa) = 11.90 - 4408/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 8.95 - 3467/(T/K)$ (liquid, Passivirta et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ and reported temperature dependence equations):

46.77 (calculated-P/C, Kurz & Ballschmiter 1999)

$\log [H/(Pa \cdot m^3/mol)] = 10.34 - 2524/(T/K)$ (Passivirta et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.11 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

2.99×10^{-3} ; 6.4×10^{-4} (quoted exptl., calculated-molar volume and mp, Ruelle & Kesselring 1997)

2.99×10^{-3} (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

2.69×10^{-4} (supercooled liquid P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

Henry's Law Constant (Pa·m³/mol at $25^{\circ}C$):

33.88 (calculated-P/C, Kurz & Ballschmiter 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.76 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.51 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: mean biological $t_{1/2} = 149$ d (range 99–302 d) in rainbow trout; mean $t_{1/2} > 170$ d (range 100 to > 300 d) for hexachlorodiphenyl ethers (Niimi 1986).

10.1.4.22 2,2',4,4',5,5'-Hexachlorodiphenyl ether (PCDE-153)

Common Name: 2,2',4,4',5,5'-Hexachlorodiphenyl ether

Synonym: PCDE-153

Chemical Name: 2,2',4,4',5,5'-hexachlorodiphenyl ether

CAS Registry No: 71859-30-8

Molecular Formula: $C_{12}H_4Cl_6O$

Molecular Weight: 376.878

Melting Point ($^{\circ}C$):

113–115 (Navalainen et al. 1994)

114 (Ruelle & Kesselring 1997)

115 (Passivirta et al. 1999)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

321.0 (calculated-Le Bas method at normal boiling point)

244.0 (Ruelle & Kesselring 1997; quoted, Passivirta et al. 1999)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

56.5 (estimated, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F: 0.134 (mp at $114^{\circ}C$)

0.126 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

1.65×10^{-4} ; 7.52×10^{-4} (quoted exptl., calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

1.65×10^{-4} (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

$\log [S_L/(mol/L)] = -1.868 - 1047/(T/K)$ (liquid, Passivirta et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

3.47×10^{-4} (supercooled liquid P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

3.74×10^{-4} ; 4.71×10^{-5} (quoted supercooled liquid P_L from Hinckley et al. 1998; converted to solid P_S with fugacity ratio F, Passivirta et al. 1999)

$\log (P_S/Pa) = 12.19 - 4916/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 9.24 - 3771/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ and reported temperature dependence equations):

79.43 (calculated-P/C, Kurz & Ballschmiter 1999)

$\log (H/(Pa m^3/mol)) = 11.11 - 2724/(T/K)$ (Passivirta et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.72 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

6.72, 6.84 (quoted lit., calculated from lit. $\log K_{OW}$ and estimated $\log S_L$, Passivirta et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.21 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, \log BCF or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: mean biological $t_{1/2} = 167$ d (range 98–553 d) in rainbow trout ; mean $t_{1/2} > 170$ d (range 100 to > 300 d) for hexachlorodiphenyl ethers (Niimi 1986).

10.1.4.23 2,2',4,4',5,6'-Hexachlorodiphenyl ether (PCDE-154)

Common Name: 2,2',4,4',5,6'-Hexachlorodiphenyl ether

Synonym: PCDE-154

Chemical Name: 2,2',4,4',5,6'-hexachlorodiphenyl ether

CAS Registry No: 106220-81-9

Molecular Formula: $C_{12}H_4Cl_6O$

Molecular Weight: 376.878

Melting Point ($^{\circ}C$):

94–96 (Navalainen et al. 1994)

95 (Ruelle & Kesselring 1997)

96 (Passivirta et al. 1999)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

321.0 (calculated-Le Bas method at normal boiling point)

244.0 (Ruelle & Kesselring 1997); quoted Passivirta et al. 1999

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

56.5 (estimated, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F: 0.206 (mp at $95^{\circ}C$)

0.198 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

3.44×10^{-3} ; 1.16×10^{-3} (quoted exptl., calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

3.44×10^{-3} (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

$\log [S_L/(mol/L)] = -1.868 - 1090/(T/K)$ (liquid, Passivirta et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

6.46×10^{-4} (supercooled liquid P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

6.64×10^{-4} ; 1.32×10^{-4} (supercooled liquid P_L , GC-RT correlation; converted to solid P_S with fugacity ratio F, Passivirta et al. 1999)

$\log (P_S/Pa) = 12.10 - 4760/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 9.15 - 4465/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ and reported temperature dependence equations):

70.79 (calculated-P/C, Kurz & Ballschmiter 1999)

$\log [H/(Pa\ m^3/mol)] = 11.02 - 2582/(T/K)$ (Passivirta et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

6.49 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

6.49, 6.93 (quoted lit., calculated from lit. $\log K_{OW}$ and estimated $\log S_L$, Passivirta et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.03 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: mean biological $t_{1/2} = 142$ d (range 90–330 d) in rainbow trout; mean $t_{1/2} > 170$ d (range 100 to > 300 d) for hexachlorodiphenyl ethers (Niimi 1986).

10.1.4.24 2,3',4,4',5,5'-Hexachlorodiphenyl ether (PCDE-167)

Common Name: 2,3',4,4',5,5'-Hexachlorodiphenyl ether

Synonym: PCDE-167

Chemical Name: 2,3',4,4',5,5'-hexachlorodiphenyl ether

CAS Registry No: 131138-20-0

Molecular Formula: $C_{12}H_4Cl_6O$

Molecular Weight: 376.878

Melting Point ($^{\circ}C$):

104–105 (Navalainen et al. 1994)

84 (Ruelle & Kesselring 1997)

105 (Passivirta et al. 1999)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

321.0 (calculated-Le Bas method at normal boiling point)

244.0 (Ruelle & Kesselring 1997; quoted Passivirta et al. 1999)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

56.5 (estimated, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F :

0.161 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

7.18×10^{-4} ; 1.51×10^{-3} (quoted exptl., calculated-molar volume, MP and mobile order thermodynamics, Ruelle & Kesselring 1997)

7.18×10^{-4} (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

$\log [S_L/(mol/L)] = -1.868 - 1117/(T/K)$ (liquid, Passivirta et al. 1999)

Vapor Pressure (Pa at 25 and reported temperature dependence equations $^{\circ}C$):

2.29×10^{-4} (supercooled liquid P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

2.49×10^{-4} ; 4.0×10^{-5} (supercooled liquid P_L , GC-RT correlation; converted to solid P_S with fugacity ratio F , Passivirta et al. 1999)

$\log (P_S/Pa) = 12.20 - 4938/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 9.25 - 3822/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ and reported temperature dependence equations):

120.23 (calculated-P/C, Kurz & Ballschmiter 1997)

$\log [H/(Pa m^3/mol)] = 11.12 - 2705/(T/K)$ (Passivirta et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.11 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

7.11, 6.99 (quoted lit., calculated from lit. $\log K_{OW}$ and estimated $\log S_L$, Passivirta et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.42 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: mean biological $t_{1/2} > 170$ d (range 100 to > 300 d) in rainbow trout for hexachlorodiphenyl ethers (Niimi 1986).

10.1.4.25 2,2',3,4,4',5,5'-Heptachlorodiphenyl ether (PCDE-180)

Common Name: 2,2',3,4,4',5,5'-Heptachlorodiphenyl ether

Synonym: PCDE-180

Chemical Name: 2,2',3,4,4',5,5'-heptachlorodiphenyl ether

CAS Registry No: 83992-69-2

Molecular Formula: $C_{12}H_3Cl_7O$

Molecular Weight: 411.324

Melting Point ($^{\circ}C$):

88–90 (Navalainen et al. 1994; quoted, Passivirta et al. 1999)

89 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

341.9 (calculated-Le Bas method at normal boiling point)

256.9 (Ruelle & Kesselring 1997; Passivirta et al. 1999)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

56.5 (estimated, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F: 0.236 (mp at $89^{\circ}C$)

0.227 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

1.30×10^{-4} ; 4.83×10^{-4} (quoted exptl.; calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

1.30×10^{-4} (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

$\log [S_L/(mol/L)] = -2.344 - 1073/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

6.31×10^{-6} (supercooled liquid P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

5.14×10^{-5} ; 1.17×10^{-5} (supercooled liquid P_L , GC-RT correlation; converted to solid P_S with fugacity ratio F, Passivirta et al. 1999)

$\log (P_S/Pa) = 12.31 - 5117/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 9.36 - 4046/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ and reported temperature dependence equations):

199.53 (calculated-P/C, Kurz & Ballschmiter 1999)

$\log [H/(Pa \cdot m^3/mol)] = 11.70 - 2973/(T/K)$ (Passivirta et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.46 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

7.46, 7.20 (quoted lit., calculated from lit. $\log K_{OW}$ and estimated $\log S_L$, Passivirta et al. 1999)

7.39 (GC-RT correlation, Hankenberg et al. 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.55 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: mean biological $t_{1/2} = 146$ d (range 90–380 d) in rainbow trout; mean $t_{1/2} > 300$ d (range 146 to > 300 d) for heptachlorodiphenyl ethers (Niimi 1986);
 $t_{1/2} = 6$ –13 d for Cl₇-DPEs to Cl₇-DPEs in various tissues of rat (Niimi et al. 1994).

10.1.4.26 2,2',3,4,4',5,6'-Heptachlorodiphenyl ether (PCDE-182)

Common Name: 2,2',3,4,4',5,6'-Heptachlorodiphenyl ether

Synonym: PCDE-182

Chemical Name: 2,2',3,4,4',5,6'-heptachlorodiphenyl ether

CAS Registry No: 88467-63-4

Molecular Formula: $C_{12}H_3Cl_7O$

Molecular Weight: 411.324

Melting Point ($^{\circ}C$):

136–138 (Navalainen et al. 1994)

136 (Passivirta et al. 1999)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

341.9 (calculated-Le Bas method at normal boiling point)

256.9 (Passivirta et al. 1999)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

362.8 (calculated-Le Bas method at normal boiling point)

269.8 (Passivirta et al. 1999)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

56.5 (estimated, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.0595 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

$\log [S_L/(mol/L)] = -2.819 - 1247/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

8.86×10^{-6} ; 5.27×10^{-6} (supercooled liquid P_L , GC-RT correlation; converted to solid P_s with fugacity ratio F, Passivirta et al. 1999)

$\log (P_s/Pa) = 12.57 - 5586/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 9.62 - 4341/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ and reported temperature dependence equations):

$\log [H/(Pa \cdot m^3/mol)] = 12.44 - 3094/(T/K)$ (Passivirta et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.88 (calculated from lit. $\log K_{OW}$ and estimated $\log S_L$, Passivirta et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: $t_{1/2} = 6 - 13$ d for Cl_7 -DPEs to Cl_9 -DPEs in various tissues of rat (Niimi et al. 1994).

10.1.4.30 2,2',3,3',4,4',6,6'-Octachlorodiphenyl ether (PCDE-197)

Common Name: 2,2',3,3',4,4',6,6'-Octachlorodiphenyl ether

Synonym: PCDE-197

Chemical Name: 2,2',3,3',4,4',6,6'-octachlorodiphenyl ether

CAS Registry No: 117948-62-6

Molecular Formula: $C_{12}H_2Cl_8O$

Molecular Weight: 445.769

Melting Point ($^{\circ}C$):

124–126 (Navalainen et al. 1994)

126 (Passivirta et al. 1999)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

362.8 (calculated-Le Bas method at normal boiling point)

269.8 (Passivirta et al. 1999)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

56.6 (estimated, Passivirta et al. 1999)

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F :

0.100 (calculated, Passivirta et al. 1999)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$ and reported temperature dependence equations):

$\log [S_L/(mol/L)] = -2.819 - 1179/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

1.75×10^{-5} ; 1.75×10^{-6} (supercooled liquid P_L , GC-RT correlation; converted to solid P_S with fugacity ratio F , Passivirta et al. 1999)

$\log (P_S/Pa) = 12.47 - 5405/(T/K)$ (solid, Passivirta et al. 1999)

$\log (P_L/Pa) = 9.52 - 4228/(T/K)$ (supercooled liquid, Passivirta et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$ and reported temperature dependence equations):

$\log [H/(Pa\ m^3/mol)] = 12.34 - 3049/(T/K)$ (Passivirta et al. 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

7.73 (calculated from lit. $\log K_{OW}$ and estimated $\log S_L$, Passivirta et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: $t_{1/2} = 6 - 13\ d$ for Cl_7 -DPEs to Cl_9 -DPEs in various tissues of rat (Niimi et al. 1994).

10.1.4.31 2,2',3,3',4,4',5,5',6-Nonachlorodiphenyl ether (PCDE-206)

Common Name: 2,2',3,3',4,4',5,5',6-Nonachlorodiphenyl ether

Synonym: PCDE-206

Chemical Name: 2,2',3,3',4,4',5,5',6-nonachlorodiphenyl ether

CAS Registry No: 83992-73-8

Molecular Formula: $C_{12}HCl_9O$

Molecular Weight: 480.214

Melting Point ($^{\circ}C$):

176–177 (Navalainen et al. 1994)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

383.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.704×10^{-6} (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

6.92×10^{-6} (supercooled liquid P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

1949.84 (calculated-P/C, Kurz & Ballschmiter 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

8.07 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.08 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: $t_{1/2} = 6 - 13$ d for Cl_7 -DPEs to Cl_9 -DPEs in various tissues of rat (Niimi et al. 1994).

10.1.4.32 Decachlorodiphenyl ether (PCDE-209)

Common Name: Decachlorodiphenyl ether

Synonym: PCDE-209

Chemical Name: decachlorodiphenyl ether

CAS Registry No: 31710-30-2

Molecular Formula: $C_{12}Cl_{10}O$

Molecular Weight: 514.659

Melting Point ($^{\circ}C$):

220–222 (Navalainen et al. 1994)

131 (Ruelle & Kesselring 1997)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

404.6 (calculated-Le Bas method at normal boiling point)

295.6 (Ruelle & Kesselring 1997)

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol\ K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56\ J/mol\ K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

5.64×10^{-8} ; 1.13×10^{-9} (quoted exptl., calculated-molar volume, mp and mobile order thermodynamics, Ruelle & Kesselring 1997)

5.64×10^{-8} (supercooled liquid, RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

1.58×10^{-6} (supercooled liquid P_L , GC-RT correlation, Kurz & Ballschmiter 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

14125 (calculated-P/C, Kurz & Ballschmiter 1999)

Octanol/Water Partition Coefficient, $\log K_{OW}$:

8.16 (RP-HPLC-RI correlation, Kurz & Ballschmiter 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

7.40 (calculated- K_{OW}/K_{AW} , Kurz & Ballschmiter 1999)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Biota: mean biological $t_{1/2} = 46\ d$ (range 27–164 d) in rainbow trout (Niimi 1986)

10.1.5 BROMINATED DIPHENYL ETHERS

10.1.5.1 2-Bromodiphenyl ether (BDE-1)

Common Name: 2-Bromodiphenyl ether

Synonym: BDE-1, PBDE-1, 1-bromo-2-phenoxybenzene, 2-bromophenyl phenyl ether, *o*-bromophenyl phenyl ether

Chemical Name: 2-monobromodiphenyl ether

CAS Registry No: 7025-06-1

Molecular Formula: $C_{12}H_9BrO$

Molecular Weight: 249.103

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

218.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

63.7 (Wong et al. 2001)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

0.163; 0.163 (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

$\log(P_L/Pa) = -3327/(T/K) + 10.37$, (GC-RT correlation, Wong et al. 2001)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

Octanol/Air Partition Coefficient, $\log K_{OA}$:

7.24; 7.34 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Air: first-order degradation $t_{1/2} = 50$ h (estimated by EPIWIN, Wania & Dugani 2003)

Surface water: first-order degradation $t_{1/2} = 900$ h (estimated by EPIWIN, Wania & Dugani 2003)

Ground water:

Sediment: first-order degradation $t_{1/2} = 3600$ h (estimated by EPIWIN, Wania & Dugani 2003)

Soil: first-order degradation $t_{1/2} = 900$ h (estimated by EPIWIN, Wania & Dugani 2003)

Biota:

10.1.5.2 3-Bromodiphenyl ether (BDE-2)

Common Name: 3-Bromodiphenyl ether

Synonym: BDE-2, PBDE-2, 1-bromo-3-phenoxybenzene, *m*-bromophenyl phenyl ether, 3-bromophenyl phenyl ether, 3-phenoxybromobenzene, 3-phenoxyphenyl bromide, *m*-bromodiphenyl ether, *m*-phenoxybromobenzene, *m*-phenoxyphenyl bromide

Chemical Name: 3-monobromodiphenyl ether

CAS Registry No: 6876-00-2

Molecular Formula: C₁₂H₉BrO

Molecular Weight: 249.103

Melting Point (°C):

Boiling Point (°C):

Density (g/cm³):

Molar Volume (cm³/mol):

218.9 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

65.4 (Wong et al. 2001)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F:

Water Solubility (g/m³ or mg/L at 25°C):

Vapor Pressure (Pa at 25°C and reported temperature dependence equation):

0.128; 0.125 (supercooled liquid P_L: calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

log (P_L/Pa) = -3416/(T/K) + 10.56, (GC-RT correlation, Wong et al. 2001)

Henry's Law Constant (Pa·m³/mol at 25°C):

Octanol/Water Partition Coefficient, log K_{OW}:

Octanol/Air Partition Coefficient, log K_{OA}:

7.36; 7.44 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, log BCF or log K_B:

Sorption Partition Coefficient, log K_{OC}:

Environmental Fate Rate Constants, k, and Half-Lives, t_{1/2}:

Half-Lives in the Environment:

10.1.5.3 4-Bromodiphenyl ether (BDE-3)

Common Name: 4-Bromophenyl phenyl ether

Synonym: BDE-3, PBDE-3, *p*-bromophenyl phenyl ether, 1-bromo-4-phenoxybenzene, 4-bromophenyl phenyl ether, 4-phenoxybromobenzene, 4-phenoxyphenyl bromide, *p*-bromodiphenyl ether, *p*-bromophenoxybenzene, *p*-phenoxybromobenzene, *p*-phenoxyphenyl bromide

Chemical Name: 4-bromodiphenyl ether, bromophenyl ether

CAS Registry No: 101-55-3

Molecular Formula: $C_{12}H_9BrO$, $C_6H_5-O-C_6H_4Br$

Molecular Weight: 249.103

Melting Point ($^{\circ}C$):

18.72 (Weast 1977, 1982–83)

18.0 (Dean 1985, 1992)

Boiling Point ($^{\circ}C$):

310.1 (Weast 1977, 1982–83)

305 (Dean 1985, 1992)

Density (g/cm^3 at $20^{\circ}C$):

1.423 (Dean 1985)

Molar Volume (cm^3/mol):

154.8 ($20^{\circ}C$, Stephenson & Malanowski 1987)

218.9 (calculated-Le Bas method at normal boiling point)

175.1 (calculated-density)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

47.9 (Tittlemier et al. 2002)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$, F: 1.0

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

4.80 (calculated- K_{ow} , Mabey et al. 1982)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equations):

0.20 ($20^{\circ}C$, calculated, Dreisbach 1952; quoted, Callahan et al. 1979; Mabey et al. 1982)

$\log(P_L/kPa) = 5.80633 - 1683.84/(-140.25 + T/K)$, temp range 463–673 K, (Antoine eq., Stephenson & Malanowski 1987)

0.259 (supercooled liquid PL, GC-RT correlation, Tittlemier et al. 2002)

$\log(P_L/Pa) = -2503/(T/K) + 7.81$, (Clausius-Clapeyron eq. from GC-RT correlation measurement, Tittlemier et al. 2002)

Henry's Law Constant ($Pa\ m^3/mol$ at $25^{\circ}C$ or as indicated):

10.13 (20 – $25^{\circ}C$, calculated-P/C, Mabey et al. 1982)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

4.28 (calculated as per Leo et al. 1971 using data of Branson 1977, Callahan et al. 1979; quoted, Ryan et al. 1988)

4.94 (calculated, Mabey et al. 1982)

5.24 (quoted, Van Leeuwen et al. 1992)

4.85 (estimated, Tittlemier et al. 2002)

Bioconcentration Factor, log BCF:

4.114 (microorganisms-water, calculated- K_{OW} , Mabey et al. 1982)

Sorption Partition Coefficient, log K_{OC} :

4.623 (sediment-water, calculated- K_{OW} , Mabey et al. 1982)

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis:

Oxidation: $\ll 360 \text{ M}^{-1} \text{ h}^{-1}$ for singlet oxygen and $\ll 1.0 \text{ M}^{-1} \text{ h}^{-1}$ for peroxy radical (Mabey et al. 1982).

Hydrolysis:

Biodegradation: estimated half-life of 4.0 h in activated sludge, based on biodegradation of 4-chlorophenyl phenyl ether in activated sewage sludge (Branson 1978; quoted, Callahan et al. 1979).

Biotransformation: estimated rate constant of $3 \times 10^{-9} \text{ mL cell}^{-1} \text{ h}^{-1}$ for the bacterial transformation in water (Mabey et al. 1982).

Bioconcentration, Uptake (k_1) and Elimination (k_2) Rate Constants or Half-Lives:

Half-Lives in the Environment:

10.1.5.4 2,4-Dibromodiphenyl ether (BDE-7)

Common Name: 2,4-Dibromodiphenyl ether

Synonym: BDE-7, PBDE-7, 2,4-dibromo-1-phenoxybenzene

Chemical Name: 2,4-dibromodiphenyl ether

CAS Registry No: 171977-44-9

Molecular Formula: $C_{12}H_8Br_2O$

Molecular Weight: 327.999

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

242.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

75.4 (Wong et al. 2001)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Molar Volume (cm^3/mol):

242.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

77.4 (Wong et al. 2001)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

0.0188–0.0127 (for dibromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

0.0119; 0.107 (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

$\log(P_L/Pa) = -4020/(T/K) + 11.56$, (GC-RT correlation, Wong et al. 2001)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.03 (for dibromodiphenyl ethers, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

5.03 (quoted value for dibromodiphenyl ether, Pijnenburg et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.55; 8.52 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

10.1.5.8 3,4'-Dibromodiphenyl ether (BDE-13)

Common Name: 3,4'-Dibromodiphenyl ether

Synonym: BDE-13, PBDE-13, 1-bromo-3-(4-bromophenoxy)-benzene

Chemical Name: 3,4'-dibromodiphenyl ether

CAS Registry No: 83694-71-7

Molecular Formula: $C_{12}H_8Br_2O$

Molecular Weight: 327.999

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

242.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

77.0 (Wong et al. 2001)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

0.0188–0.0127 (for dibromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

0.0113; 0.0101 (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

$\log(P_L/Pa) = -4044/(T/K) + 11.62$, (GC-RT correlation, Wong et al. 2001)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.03 (for dibromodiphenyl ethers, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

5.03 (quoted value for dibromodiphenyl ether, Pijnenburg et al. 1995)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

8.57; 8.54 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{oc}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

10.1.5.9 4,4'-Dibromodiphenyl ether (BDE-15)

Common Name: 4,4'-Dibromodiphenyl ether

Synonym: BDE-15, PBDE-15, 1,1-oxybis[4-bromo]benzene, bis(4-bromophenyl)ether, *p*, *p'*-dibromodiphenyl ether

Chemical Name: 4,4'-dibromodiphenyl ether

CAS Registry No: 2050-47-7

Molecular Formula: C₁₂H₈Br₂O

Molecular Weight: 327.999

Melting Point (°C):

57–58 (Tittlemier et al. 2002)

57.7 (Wania & Dugani 2003)

Boiling Point (°C):

Density (g/cm³):

Molar Volume (cm³/mol):

242.2 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

78.0 (Wong et al. 2001)

67.7 (Tittlemier et al. 2002)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at 25°C (assuming ΔS_{fus} = 56 J/mol K), F:

0.477 (mp at 57.5°C, Wania & Dugani 2003)

Water Solubility (g/m³ or mg/L at 25°C):

0.130 (generator column-GC/ECD, Tittlemier et al. 2002)

0.273, 0.79 (supercooled S_L, selected measured value, final adjusted value, Wania & Dugani 2003)

Vapor Pressure (Pa at 25°C and reported temperature dependence equation):

0.0188–0.0127 (for dibromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

9.84 × 10⁻³; 8.80 × 10⁻³ (supercooled liquid P_L: calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

log (P_L/Pa) = -4074/(T/K) + 11.65, (GC-RT correlation, Wong et al. 2001)

0.0173 (supercooled liquid P_L, GC-RT correlation, Tittlemier et al. 2002)

log (P_L/Pa) = -3528/(T/K) + 10.08, (Clausius-Clapeyron equation from GC-RT correlation measurements, Tittlemier et al. 2002)

0.0143, 0.010 (supercooled, P_L, selected measured value, final adjusted value, Wania & Dugani 2003)

Henry's Law Constant (Pa·m³/mol at 25°C):

21 (calculated-P_L/C_L, Tittlemier et al. 2002)

4.11 (Wania & Dugani 2003)

Octanol/Water Partition Coefficient, log K_{OW}:

5.03 (for dibromodiphenyl ethers, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

5.03 (value for dibromodiphenyl ether, Pijnenburg et al. 1995)

5.55 (estimated, Tittlemier et al. 2002)

5.03, 5.48 (selected measured value, final adjusted value, Wania & Dugani 2003)

Octanol/Air Partition Coefficient, log K_{OA}:

8.64; 8.60 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

8.79, 8.63 (selected measured value, final adjusted value, Wania & Dugani 2003)

Bioconcentration Factor, log BCF or log K_B :

Sorption Partition Coefficient, log K_{OC} :

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: photochemical degradation pathway of BDE15 undergoes strict debromination via first-order decay, $k = 1.98 \times 10^{-2} \text{ min}^{-1}$ in 100% CH_3CN and $k = 3.10 \times 10^{-2} \text{ min}^{-1}$ in CH_3OH , corresponding to $t_{1/2} \sim 30 \text{ min}$. (Rayne et al. 2003)

Photooxidation:

Hydrolysis:

Biodegradation: complete debromination under anaerobic microbial degradation in a fixed-film plug-flow bioreactor (Rayne et al. 2003)

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

Half-Lives in the Environment:

Air: first order degradation $t_{1/2} = 120 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003)

Surface water: first order degradation $t_{1/2} = 1440 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003)

Ground water:

Sediment: first order degradation $t_{1/2} = 5760 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003)

Soil: first order degradation $t_{1/2} = 1440 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003)

Biota:

10.1.5.10 2,2',4-Tribromodiphenyl ether (BDE-17)

Common Name: 2,2',4-Tribromodiphenyl ether

Synonym: PBDE-17

Chemical Name: 2,2',4-tribromodiphenyl ether

CAS Registry No: 147217-75-2

Molecular Formula: $C_{12}H_7Br_3O$

Molecular Weight: 406.895

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

265.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00038 (calculated for triBDE, Alcock et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ at $25^{\circ}C$ and reported temperature dependence equation):

0.00266–0.00150 (for tribromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

0.00266–0.00150 (estimated for tri-BDE, Alcock et al. 1999)

0.00219 (supercooled P_L , GC-RT correlation on a CPSil-8 column, Wong et al. 2001)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.47–5.58 (for tribromodiphenyl ethers, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

5.47–5.58 (quoted range of value for tribromodiphenyl ether, Pijnenburg et al. 1995; Alcock et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

9.30* (generator column-GC/MS, measured range 15 – $45^{\circ}C$, Harner & Shoeib 2002)

$\log K_{OA} = -3.54 + 3803/(T/K)$, temp range: 15 – $45^{\circ}C$ (generator column-GC/MS, Harner & Shoeib 2002)

9.966, 9.385, 8.841, 8.332 (15 , 25 , 35 , $45^{\circ}C$, calculated-QRSETP model 3, Chen et al. 2002)

9.919, 9.339, 8.789, 8.290 (15 , 25 , 35 , $45^{\circ}C$, calculated-QRSETP model 5, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Chemical Name: 2',3,4-tribromodiphenyl ether

CAS Registry No: 147217-78-5

Molecular Formula: $C_{12}H_7Br_3O$

Molecular Weight: 406.895

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

265.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

81.0 (Wong et al. 2001)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00038 (calculated for tri-BDE, Alcock et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

0.00266–0.00150 (for tribromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

0.00266–0.01150 (estimated for tri-BDE, Alcock et al. 1999)

1.78×10^{-3} ; 1.49×10^{-3} (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

$\log(P_L/Pa) = -4443/(T/K) + 12.15$, (GC-RT correlation, Wong et al. 2001)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.47–5.58 (for tribromodiphenyl ethers, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

5.47–5.58 (quoted range of values for tribromodiphenyl ether, Pijnenburg et al. 1995; Alcock et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

10.1.5.15 3,3',4-Tribromodiphenyl ether (BDE-35)

Common Name: 3,3',4-Tribromodiphenyl ether

Synonym: PBDE-35, BDE-35, 1,2-dibromo-4-(4-bromophenoxy)-benzene

Chemical Name: 3,3',4-tribromodiphenyl ether

CAS Registry No: 147217-80-9

Molecular Formula: $C_{12}H_7Br_3O$

Molecular Weight: 406.895

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

265.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

86.4 (Wong et al. 2001)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00038 (calculated for triBDE, Alcock et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

0.00266–0.00150 (for tribromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

0.00266–0.00155 (estimated for triBDE, Alcock et al. 1999)

1.39×10^{-3} ; 1.15×10^{-3} (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

$\log(P_L/Pa) = -4512/(T/K) + 12.28$, (GC-RT correlation, Wong et al. 2001)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{OW}$:

5.47–5.58 (for tribromodiphenyl ethers, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

5.47–5.58 (quoted range of values for tribromodiphenyl ethers, Pijnenburg et al. 1995; Alcock et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.61; 9.48 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

10.1.5.16 3,4,4'-Tribromodiphenyl ether (BDE-37)

Common Name: 3,4,4'-Tribromodiphenyl ether

Synonym: PBDE-37, BDE-37, 1,2-dibromo-4-(4-bromophenoxy)-benzene

Chemical Name: 3,4,4'-tribromodiphenyl ether

CAS Registry No: 147217-81-0

Molecular Formula: $C_{12}H_7Br_3O$

Molecular Weight: 406.895

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

265.5 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

86.7 (Wong et al. 2001)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00038 (calculated for tri-BDE, Alcock et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

0.00266–0.00150 (for tribromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

0.00266–0.00150 (estimated for tri-BDE, Alcock et al. 1999)

1.02×10^{-3} ; 8.0×10^{-4} (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

$\log(P_L/Pa) = -4528/(T/K) + 12.20$, (GC-RT correlation, Wong et al. 2001)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.47–5.58 (for tribromodiphenyl ethers, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

5.47–5.58 (quoted range of values for tribromodiphenyl ether, Pijnenburg et al. 1995; Alcock et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

9.68; 9.54 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

10.1.5.17 2,2',4,4'-Tetrabromodiphenyl ether (BDE-47)

Common Name: 2,2',4,4'-Tetrabromodiphenyl ether

Synonym: PBDE-47, BDE-47, 1,1'-oxybis[2,4-dibromo-benzene], NSC 21724

Chemical Name: 2,2',4,4'-tetrabromodiphenyl ether

CAS Registry No: 5436-43-1

Molecular Formula: $C_{12}H_6Br_4O$

Molecular Weight: 485.791

Melting Point ($^{\circ}C$):

83.5–84.5 (Tittlemier et al. 2002)

84.0 (Wania & Dugani 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

288.8 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

103.13 (Tittlemier & Tomy 2001)

92.0 (Wong et al. 2001)

94.6 (Tittlemier et al. 2002)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.261 (calculated at mp $84^{\circ}C$, Wania & Dugani 2002)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

0.00007 (calculated for tetra-BDE, Alcock et al. 1999)

0.015 (solid S_s , generator column-GC/ECD, Tittlemier et al. 2002)

0.0496, 0.0947 (supercooled liquid S_L , selected measured value, final adjusted value, Wania & Dugani 2003)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

3.35×10^{-4} – 2.60×10^{-4} (for tetrabromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

2.19×10^{-5} (supercooled liquid P_L : GC-RT correlation, Tittlemier & Tomy 2001)

$\log(P_L/Pa) = -5386/(T/K) + 13.42$, (GC-RT correlation, Tittlemier & Tomy 2001)

3.19×10^{-4} ; 2.50×10^{-4} (supercooled P_L : calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

$\log(P_L/Pa) = -4805/(T/K) + 12.62$, (GC-RT correlation, Wong et al. 2001)

1.86×10^{-4} (supercooled liquid P_L , GC-RT correlation, Tittlemier et al. 2002)

$\log(P_L/Pa) = -4940/(T/K) + 12.85$, (Clausius-Clapeyron eq. from GC-RT correlation, Tittlemier et al. 2002)

2.66×10^{-4} , 2.15×10^{-4} (supercooled P_L , selected measured value, final adjusted value, Wania & Dugani 2003)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

1.5 (calculated-P/C, Tittlemier et al. 2002)

1.107 (Wania & Dugani 2003)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

5.87–6.16 (for tetrabromodiphenyl ethers, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

5.87–6.16 (quoted range for tetra-PBDE, Pijnenburg et al. 1995; Alcock et al. 1999)

6.02 (mean value of Watanabe & Tatsukawa, Gustafsson et al. 1999)

6.55 (estimated, Tittlemier et al. 2002)

6.11, 6.39 (selected measured value, final adjusted value, Wania & Dugani 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at 25°C or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

10.53* (generator column-GC/MS, measured range 15–45°C, Harner & Shoeib 2002)

$\log K_{OA} = -6.47 + 5068/(T/K)$, temp range: 15–45°C (generator column-GC/MS, Harner & Shoeib 2002)

10.987, 10.406, 9.863, 9.353 (15, 25, 35, 45°C, calculated-QRSETP model 3, Chen et al. 2002)

10.928, 10.349, 9.807, 9.300 (15, 25, 35, 45°C, calculated-QRSETP model 5, Chen et al. 2002)

10.34; 10.14 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

10.53, 10.44 (selected measured value, final adjusted value, Wania & Dugani 2003)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_1 = 120 \text{ L d}^{-1} \text{ g}^{-1} \text{ dry wt}$, $k_2 = 0.090 \text{ d}^{-1}$ in blue mussels (Gustafsson et al. 1999)

$k_1 = 0.108 \text{ g org. C g}^{-1} \text{ lipid h}^{-1}$ in Lake Höytiäinen sediment; $0.251 \text{ g org. C g}^{-1} \text{ lipid h}^{-1}$ in Lake Kuorinka sediment (sediment ingesting oligochaetes, Leppänen & Kukkonen 2004)

$k_2 = 0.034 \text{ d}^{-1}$ in Lake Höytiäinen sediment; 0.071 d^{-1} in Lake Kuorinka sediment (sediment ingesting oligochaetes, Leppänen & Kukkonen 2004)

$k_2 = 0.023 \text{ d}^{-1}$ with $t_{1/2} = 30.1 \text{ d}$ (juvenile carp in 100-d experiment Stapleton et al. 2004b)

Half-Lives in the Environment:

Air: first order degradation $t_{1/2} = 256 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003)

Surface water: first order degradation $t_{1/2} = 3600 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003)

Ground water:

Sediment: first order degradation $t_{1/2} = 14400 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003)

Soil: first order degradation $t_{1/2} = 3600 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003)

Biota: depuration half-life of 7.7 d in blue mussels (Gustafsson et al. 1999);

biphasic depuration kinetics observed in oligochaete tissues with half-life of 10.5–47.5 h in compartment A for sediment ingesting oligochaetes (Leppänen & Kukkonen 2004)

depuration $t_{1/2} = 30.1 \text{ d}$ (juvenile carp in 100-d experiment Stapleton et al. 2004b)

10.1.5.21 2,2',3,3',4-Pentabromodiphenyl ether (BDE-82)

Common Name: 2,2',3,3',4-Pentabromodiphenyl ether

Synonym: PBDE-82, BDE-82, 1,2,3-tribromo-4-(2,3-dibromophenoxy)-benzene

Chemical Name: 2,2',3,3',4-pentabromodiphenyl ether

CAS Registry No: 327185-11-5

Molecular Formula: $C_{12}H_5Br_5O$

Molecular Weight: 564.687

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

312.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

99.1 (Wong et al. 2001)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

6.47×10^{-7} (calculated for pentaBDE, Alcock et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

7.33×10^{-5} – 1.43×10^{-5} (for pentabromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

0.07 (estimated for pentaBDE, Alcock et al. 1999)

6.47×10^{-5} ; 4.80×10^{-5} (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

$\log(P_L/Pa) = -5175/(T/K) + 13.12$, (GC-RT correlation, Wong et al. 2001)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.64–6.97 (for pentabromodiphenyl ethers, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

6.64–6.97 (quoted range for penta-PBDE, Pijnenburg et al. 1995; Alcock et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

11.14; 10.86 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Half-Lives in the Environment:

10.1.5.22 2,2',3,4,4'-Pentabromodiphenyl ether (BDE-85)

Common Name: 2,2',3,4,4'-Pentabromodiphenyl ether

Synonym: PBDE-85, BDE-85, 1,2,3-tribromo-4-(2,4-dibromophenoxy)-benzene

Chemical Name: 2,2',3,4,4'-pentabromodiphenyl ether

CAS Registry No: 182346-21-0

Molecular Formula: $C_{12}H_5Br_5O$

Molecular Weight: 564.687

Melting Point ($^{\circ}C$):

119–121 (Tittlemier et al. 2002)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

312.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

110.95 (Tittlemier & Tomy 2001)

110 (Tittlemier et al. 2002)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

6.47×10^{-7} (calculated for pentaBDE, Alcock et al. 1999)

0.006 (generator column-GC/ECD, Tittlemier et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

7.33×10^{-5} – 1.43×10^{-5} (for pentabromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

0.07 (estimated for pentaBDE, Alcock et al. 1999)

2.88×10^{-6} (supercooled liquid P_L : GC-RT correlation, Tittlemier & Tomy 2001)

$\log(P_L/Pa) = -5795/(T/K) + 13.91$, (GC-RT correlation, Tittlemier & Tomy 2001)

2.81×10^{-5} (supercooled P_L , GC-RT correlation on a CPSil-8 column, Wong et al. 2001)

9.86×10^{-6} (supercooled liquid P_L : GC-RT correlation, Tittlemier et al. 2002)

$\log(P_L/Pa) = -5761/(T/K) + 14.43$, (Clausius-Clapeyron eq. from GC-RT correlation, Tittlemier et al. 2002)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.11 (calculated- P_L/C_L , Tittlemier et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.64–6.97 (for pentabromodiphenyl ethers, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

6.64–6.97 (quoted range for penta-PBDE, Pijnenburg et al. 1995; Alcock et al. 1999)

7.03 (estimated, Tittlemier et al. 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

11.66* (generator column-GC/MS, measured range 15 – $45^{\circ}C$, Harner & Shoeib 2002)

12.312, 11.631, 11.118, 10.544 (15 , 25 , 35 , $45^{\circ}C$, generator column-GC/MS, Harner & Shoeib 2002)

$\log K_{OA} = -6.22 + 5331/(T/K)$, temp range: 15 – $45^{\circ}C$ (generator column-GC/MS, Harner & Shoeib 2002)

12.131, 11.549, 11.006, 10.497 (15 , 25 , 35 , $45^{\circ}C$, calculated-QRSETP model 3, Chen et al. 2002)

FIGURE 10.1.5.24.1 Logarithm of K_{OA} versus reciprocal temperature for 2,2',4,4',6-pentabromodiphenyl ether (PBDE-100).

10.1.5.25 2,3,4,4',6-Pentabromodiphenyl ether (BDE-115)

Common Name: 2,3,4,4',6-Pentabromodiphenyl ether

Synonym: PBDE-115, BDE-115, 1,2,3,5-tetrabromo-4-(4-bromophenoxy)benzene

Chemical Name: 2,3,4,4',6-pentabromodiphenyl ether

CAS Registry No: 446254-78-0

Molecular Formula: $C_{12}H_5Br_5O$

Molecular Weight: 564.687

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

312.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

101.8 (Wong et al. 2001)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} ($J/mol K$):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56 J/mol K$), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

6.47×10^{-7} (calculated for penta-BDE, Alcock et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$ and reported temperature dependence equation):

7.33×10^{-5} – 1.43×10^{-5} (for pentabromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

0.07 (estimated for penta-BDE, Alcock et al. 1999)

3.02×10^{-5} ; 3.20×10^{-5} (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

$\log(P_L/Pa) = -5219/(T/K) + 13.32$, (GC-RT correlation, Wong et al. 2001)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.64–6.97 (range for penta-PBDEs, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

6.64–6.97 (quoted range for penta-PBDE, Pijnenburg et al. 1995; Alcock et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$:

11.52; 11.20 (calibrated GC-RT correlation; GC-RT correlation, Wania et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

10.1.5.26 3,3',4,4',5-Pentabromodiphenyl ether (BDE-126)

Common Name: 3,3',4,4',5-Pentabromodiphenyl ether

Synonym: PBDE-126, BDE-126, 1,2,3-tribromo-5-(3,4-dibromophenoxy)-benzene

Chemical Name: 3,3',4,4',5-pentabromodiphenyl ether

CAS Registry No: 366791-32-4

Molecular Formula: $C_{12}H_5Br_5O$

Molecular Weight: 564.687

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

312.1 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

4.08×10^{-6} (calculated for hexa-PBDEs, Alcock et al. 1999)

Vapor Pressure (Pa at $25^{\circ}C$):

$9.44 \times 10^{-6} - 4.22 \times 10^{-6}$ (for hexabromodiphenyl ethers, GC-RT correlation, Watanabe & Tatsukawa 1989)

0.95–0.99 (estimated for hexa-PBDEs, Alcock et al. 1999)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

6.86–7.93 (range for hexa-PBDEs, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

6.86–7.92 (quoted range for hexa-PBDEs, Pijnenburg et al. 1995; Alcock et al. 1999)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

11.97* (generator column-GC/MS, measured range $15-45^{\circ}C$, Harner & Shoeib 2002)

$\log K_{OA} = -5.80 + 5298/(T/K)$, temp range: $15-45^{\circ}C$ (generator column-GC/MS, Harner & Shoeib 2002)

13.211, 12.630, 12.087, 11.577 (15, 25, 35, $45^{\circ}C$, calculated-QRSETP model 3, Chen et al. 2002)

13.150, 12.571, 12.029, 11.522 (15, 25, 35, $45^{\circ}C$, calculated-QRSETP model 5, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

TABLE 10.1.5.30.1

FIGURE 10.1.5.30.1 Logarithm of K_{OA} versus reciprocal temperature for 2,3,3',4,4',5'-hexabromodiphenyl ether (PBDE-156).

10.1.5.31 2,2',3,4,5,5',6-Heptabromodiphenyl ether (BDE-183)

Common Name: 2,2',3,4,5,5',6-Heptabromodiphenyl ether

Synonym: PBDE-183, BDE-183, 1,2,3,5-tetrabromo-4-(2,4,5-trobromophenoxy)-benzene

Chemical Name: 2,2',3,4,5,5',6-heptabromodiphenyl ether

CAS Registry No: 207122-16-5

Molecular Formula: $C_{12}H_3Br_7O$

Molecular Weight: 722.479

Melting Point ($^{\circ}C$):

171–173 (Tittlemier et al. 2002)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

358.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

118 (Tittlemier et al. 2002)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

0.035 (calculated at mp $172^{\circ}C$, Wania & Dugani 2003)

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

1.50×10^{-6} (generator column-GC/ECD, Tittlemier et al. 2002)

Vapor Pressure (Pa at $25^{\circ}C$ and the reported temperature dependence equations):

4.68×10^{-7} (supercooled liquid P_L : GC-RT correlation, Tittlemier et al. 2002)

$\log(P_L/Pa) = -6185/(T/K) + 14.43$, (Clausius-Clapeyron eq. from GC-RT correlation, Tittlemier et al. 2002)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

0.0074 (calculated- P_L/C_L , Tittlemier et al. 2002)

Octanol/Water Partition Coefficient, $\log K_{ow}$:

7.14 (quoted, Wania & Dugani 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$ at $25^{\circ}C$ or as indicated and reported temperature dependence equations.

Additional data at other temperatures designated * are compiled at the end of this section:

11.96* (generator column-GC/MS, measured range 15 – $45^{\circ}C$, Harner & Shoeib 2002)

$\log K_{OA} = -3.71 + 4672/(T/K)$, temp range: 15 – $45^{\circ}C$ (generator column-GC/MS, Harner & Shoeib 2002)

13.263, 12.681, 12.138, 11.628 (15, 25, 35, $45^{\circ}C$, calculated-QRSETP model 3, Chen et al. 2002)

13.206, 12.627, 12.085, 11.577 (15, 25, 35, $45^{\circ}C$, calculated-QRSETP model 5, Chen et al. 2002)

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

Air: first-order degradation $t_{1/2} = 1540$ h (estimated by EPIWIN, Wania & Dugani 2003)

Surface water: first-order degradation $t_{1/2} = 3600$ h (estimated by EPIWIN, Wania & Dugani 2003)

Ground water:

Sediment: first order degradation $t_{1/2} = 14400$ h (estimated by EPIWIN, Wania & Dugani 2003)

Soil: first order degradation $t_{1/2} = 3600$ h (estimated by EPIWIN, Wania & Dugani 2003)

Biota:

10.1.5.32 2',3,3',4,4',5,6-Heptabromodiphenyl ether (BDE-190)

Common Name: 2',3,3',4,4',5,6-Heptabromodiphenyl ether

Synonym: PBDE-190, BDE-190, pentabromo-(3,4-dibromophenoxy)-benzene

Chemical Name: 2',3,3',4,4',5,6-heptabromodiphenyl ether

CAS Registry No: 189084-68-2

Molecular Formula: $C_{12}H_3Br_7O$

Molecular Weight: 722.479

Melting Point ($^{\circ}C$):

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

358.7 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

121.15 (Tittlemier & Tomy 2001)

115.8 (Wong et al. 2001)

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

Vapor Pressure (Pa at $25^{\circ}C$ at $25^{\circ}C$ and reported temperature dependence equation):

2.34×10^{-7} (supercooled liquid P_L : GC-RT correlation, Tittlemier & Tomy 2001)

$\log(P_L/Pa) = -6327/(T/K) + 14.60$, (GC-RT correlation, Tittlemier & Tomy 2001)

9.05×10^{-7} ; 5.70×10^{-7} (supercooled liquid P_L : calibrated GC-RT correlation; GC-RT correlation, Wong et al. 2001)

$\log(P_L/Pa) = -6048/(T/K) + 14.24$, (GC-RT correlation, Wong et al. 2001)

2.82×10^{-7} (supercooled liquid P_L : GC-RT correlation, Tittlemier et al. 2002)

$\log(P_L/Pa) = -6552/(T/K) + 15.44$, (Clausius-Clapeyron eq. from GC-RT correlation, Tittlemier et al. 2002)

Henry's Law Constant ($Pa \cdot m^3/mol$ at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

8.36 (estimated, Tittlemier et al. 2002)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constants, k , and Half-Lives, $t_{1/2}$:

Half-Lives in the Environment:

10.1.5.33 Decabromodiphenyl ether (BDE-209)

Common Name: Decabromodiphenyl ether

Synonym: PBDE-209, BDE-209, 1,1'-oxybis[2,3,4,5,6-pentabromo]-benzene, bis(pentabromophenyl)-ether, 102(E), 2,2',3,3',4,4',5,5',6,6'-decabromodiphenyl ether, Decabromobiphenyl oxide, decabromophenyl ether

Chemical Name: decabromodiphenyl ether

CAS Registry No: 1163-19-5

Molecular Formula: $C_{12}Br_{10}O$

Molecular Weight: 959.167

Melting Point ($^{\circ}C$):

302.5 (Wania & Dugani 2003)

Boiling Point ($^{\circ}C$):

Density (g/cm^3):

Molar Volume (cm^3/mol):

428.6 (calculated-Le Bas method at normal boiling point)

Enthalpy of Vaporization, ΔH_v (kJ/mol):

Enthalpy of Sublimation, ΔH_{subl} (kJ/mol):

Enthalpy of Fusion, ΔH_{fus} (kJ/mol):

Entropy of Fusion, ΔS_{fus} (J/mol K):

Fugacity Ratio at $25^{\circ}C$ (assuming $\Delta S_{fus} = 56$ J/mol K), F:

Water Solubility (g/m^3 or mg/L at $25^{\circ}C$):

4.17×10^{-9} (solid S_s , quoted lit., Wania & Dugani 2003)

Vapor Pressure (Pa at $25^{\circ}C$):

2.95×10^{-9} (supercooled liquid P_L , estimated, Wania & Dugani 2003)

Henry's Law Constant (Pa·m³/mol at $25^{\circ}C$):

Octanol/Water Partition Coefficient, $\log K_{ow}$:

9.97 (decabromodiphenyl ether, reversed phase-HPLC-RT correlation, Watanabe & Tatsukawa 1989)

9.97 (quoted from Watanabe & Tatsukawa 1990, Pijnenburg et al. 1995)

9.97 (quoted, Wania & Dugani 2003)

Octanol/Air Partition Coefficient, $\log K_{OA}$:

Bioconcentration Factor, $\log BCF$ or $\log K_B$:

Sorption Partition Coefficient, $\log K_{OC}$:

Environmental Fate Rate Constant, k , and Half-Lives, $t_{1/2}$:

Volatilization:

Photolysis: half-lives on different matrices, indoors under artificial UV-light "continuous": $t_{1/2} < 0.25$ h on silica gel, $t_{1/2} = 12$ h on sand, $t_{1/2} = 40$ – 60 h on sediment and $t_{1/2} = 150$ – 200 h in soil; for outdoors under sunlight "discontinuous": $t_{1/2} = 37$ h on sand and 80 h on sediment; for outdoor sunlight "continuous": $t_{1/2}(\text{calc}) = 13$ h on sand and $t_{1/2}(\text{calc}) = 30$ on sediment (Söderström et al. 2004)

Photooxidation:

Hydrolysis:

Biodegradation: anaerobic degradation decreased by 30% within 238 d corresponding to a pseudo-first-order $k = 1 \times 10^{-3} d^{-1}$ by sewage sludge collected from a mesophilic digester (Gerecke et al. 2005)

Biotransformation:

Bioconcentration and Uptake and Elimination Rate Constants (k_1 and k_2):

$k_2 = 1.4 \times 10^{-2} \text{ d}^{-1}$ with $t_{1/2} = 50 \text{ d}$ in juvenile carp (Stapleton et al. 2004)

Half-Lives in the Environment:

Air: first order degradation $t_{1/2} = 7620 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003)

Surface water: first order degradation $t_{1/2} = 3600 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003)

Ground water:

Sediment: first order degradation $t_{1/2} = 14400 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003); photolysis half-lives on different matrices, indoors under artificial UV-light "continuous": $t_{1/2} = 40\text{--}60 \text{ h}$ on sediment; for outdoors under sunlight "discontinuous": $t_{1/2} = 80 \text{ h}$ on sediment; for outdoor sunlight "continuous": $t_{1/2}(\text{calc}) = 30$ on sediment (Södertröm et al. 2004)

Soil: first order degradation $t_{1/2} = 3600 \text{ h}$ (estimated by EPIWIN, Wania & Dugani 2003); photolysis half-lives on different matrices, indoors under artificial UV-light "continuous": $t_{1/2} = 12 \text{ h}$ on sand, and $150\text{--}200 \text{ h}$ in soil; for outdoors under sunlight "discontinuous": 37 h on sand; for outdoor sunlight "continuous": $t_{1/2}(\text{calc}) = 13 \text{ h}$ on sand (Södertröm et al. 2004)

Biota: depuration $t_{1/2} = 50 \pm 17 \text{ d}$ in juvenile carp (Stapleton et al. 2004)

10.2 SUMMARY TABLES AND QSPR PLOTS

TABLE 10.2.1

Summary of physical properties of ethers and halogenated ethers

TABLE 10.2.2 (Continued)

Compound	Selected properties						Henry's law constant H/(Pa·m³/mol) calculated P/C
	Vapor pressure		Solubility			log K _{OW}	
	P ^S /Pa	P _L /Pa	S/(g/m³)	C ^S /(mol/m³)	C _L /(mol/m³)		
2,3,4-Trichloroanisole			10.8	0.0511	0.1411	4.03	
2,4,6-Trichloroanisole			13.2	0.0624	0.1425	4.02	
2,3,4,5-Tetrachloroanisole			1.35	0.0055	0.0228	4.50	
2,3,5,6-Tetrachloroanisole			1.82	0.0074	0.0280	4.40	
Veratrole (1,2-Dimethoxybenzene)			6690	48.42	48.42	2.18	
4,5-Dichloroveratrole			72	0.2477	1.2879	3.11	
3,4,5-Trichloroveratrole			10.3	0.0426	0.1077	4.01	
Tetrachloroveratrole			1.59	0.0058	0.0250	4.86	
Phenetole (Ethoxybenzene)	204	204	569	4.658	4.658	2.68	43.80
Benzyl ethyl ether	100	100				2.64	
Styrene oxide	40	40	2800	23.30	23.0	1.61	1.716
Diphenyl ether	2.93	3.05	18.7	0.1099	0.1146	4.21	26.67

* Vapor pressure exceeds atmospheric pressure, Henry's law constant H (Pa·m³/mol) = 101325 Pa/C^S mol/m³.

TABLE 10.2.3

Suggested half-life classes of ethers and halogenated ethers in various environmental compartments at 25°C

Compound	Air class	Water* class	Soil class	Sediment class
Aliphatic ethers:				
Dimethyl ether (Methyl ether)	2	5	5	6
Diethyl ether (Ethyl ether)	2	5	5	6
Methyl <i>t</i> -butyl ether (MTBE)	2	5	5	6
Di- <i>n</i> -propyl ether	2	5	5	6
1,2-Propylene oxide	2	4	5	6
Furan	2	4	5	6
Tetrahydrofuran	2	4	5	6
1,4-Dioxane	2	4	5	6
Halogenated ethers:				
Chloromethyl methyl ether	2	5	5	6
Bis(chloromethyl)ether	2	5	5	6
Bis(2-chloroethyl)ether	2	5	5	6
Bis(2-chloroisopropyl)ether	2	5	5	6
2-Chloroethyl vinyl ether	2	5	5	6
Bis(2-chloroethoxy)methane	2	5	5	6
Aromatic ethers:				
Anisole (Methoxybenzene)	2	5	5	6
Styrene oxide	2	4	5	6
Diphenyl ether	2	5	5	6

* Certain ethers will have much shorter half-lives because of hydrolysis with singlet oxygen, and biodegradation; this half-life class is conservatively assigned, see [Chapter 1](#) for a discussion.

where,

	Class	Mean half-life (h)	Range (h)
1		5	< 10
2		17 (~ 1 d)	10–30
3		55 (~ 2 d)	30–100
4		170 (~ 1 week)	100–300
5		550 (~ 3 weeks)	300–1,000
6		1700 (~ 2 months)	1,000–3,000
7		5500 (~ 8 months)	3,000–10,000
8		17000 (~ 2 years)	10,000–30,000
9		55000 (~ 6 years)	> 30,000
